

AMAP-Colloquium January 31st, 2019

Ultrasonic Inspection of aluminum components

Conventional to phased array, manual to automatic

Stefan Kierspel

KARL DEUTSCH Prüf- und Messgerätebau GmbH + Co KG

Wuppertal

KARL DEUTSCH

Contents

- Introduction to KARL DEUTSCH
- Basics of UT inspection
- Distinctiveness of UT testing on aluminum
- Inspection of welds on thin plates with complex geometries
- Inspection of casted aluminum plates
- Integrated precision measurement of wall thickness
- Inspection of spotwelded aluminum plates
- Different types of automatic testing machines

Introduction to KARL DEUTSCH

KARL DEUTSCH

Ing. Karl Deutsch & LEPTOSKOP

LEPTOSKOP
coating thickness
measurement
since 1948,
founding of company
May 13th 1949

KARL DEUTSCH

KARL DEUTSCH

KARL DEUTSCH

- Founded in 1949, family business in 3rd generation
- Two locations in Wuppertal
- 130 employees in Wuppertal +20 more worldwide

Ing. Karl
Deutsch
1900 -
1975

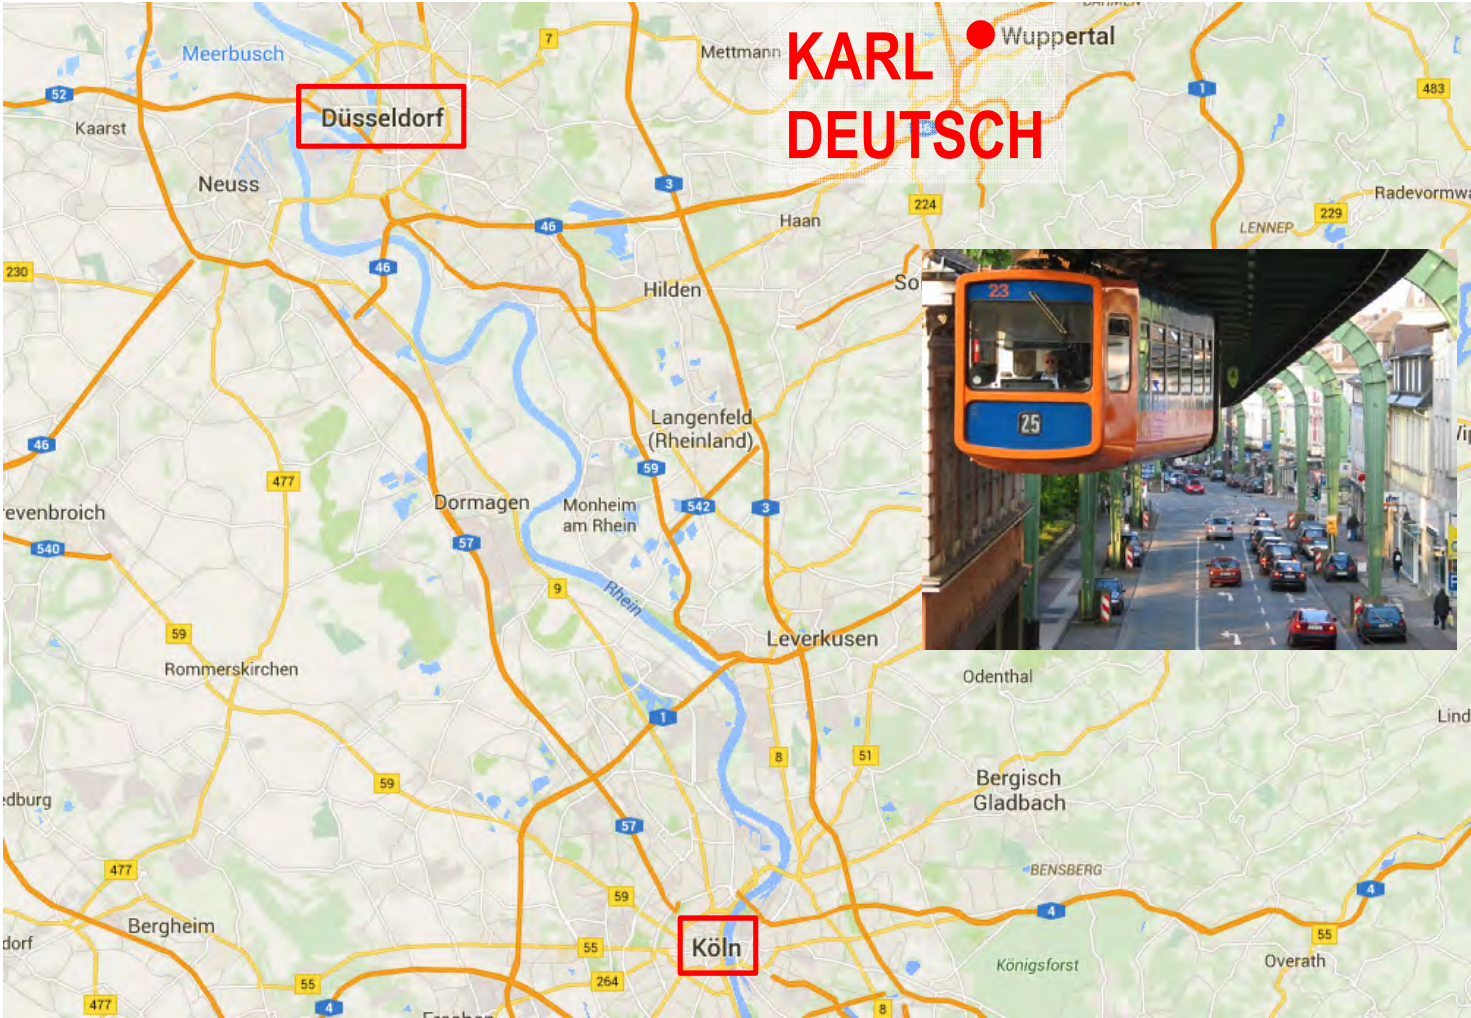

Prof. Dr. Volker
Deutsch
* 1932, KD 1961-
2001

Dr. (USA)
Wolfram
Deutsch
KD 1998 - ...

KARL DEUTSCH in Wuppertal

KARL DEUTSCH

Works 1: Portables, R&D, Administration

KARL DEUTSCH

Works 2: Testing Systems Production

KARL DEUTSCH

KARL DEUTSCH Product Range

- Machines, instruments and equipment for PT, MT and UT
- UT probes development and manufacturing
- Portable units for coating- and wall-thickness measurement
- Portable units for measurement of magnetic fields

KARL DEUTSCH

Application-Laboratory

- Consulting
- Tests on customer specimens
- Instrument-Training
- Application development

Dr. rer. nat. Helge Rast
(Laboratory head)

Dr.-Ing. Volker Schuster

Basics of UT inspection

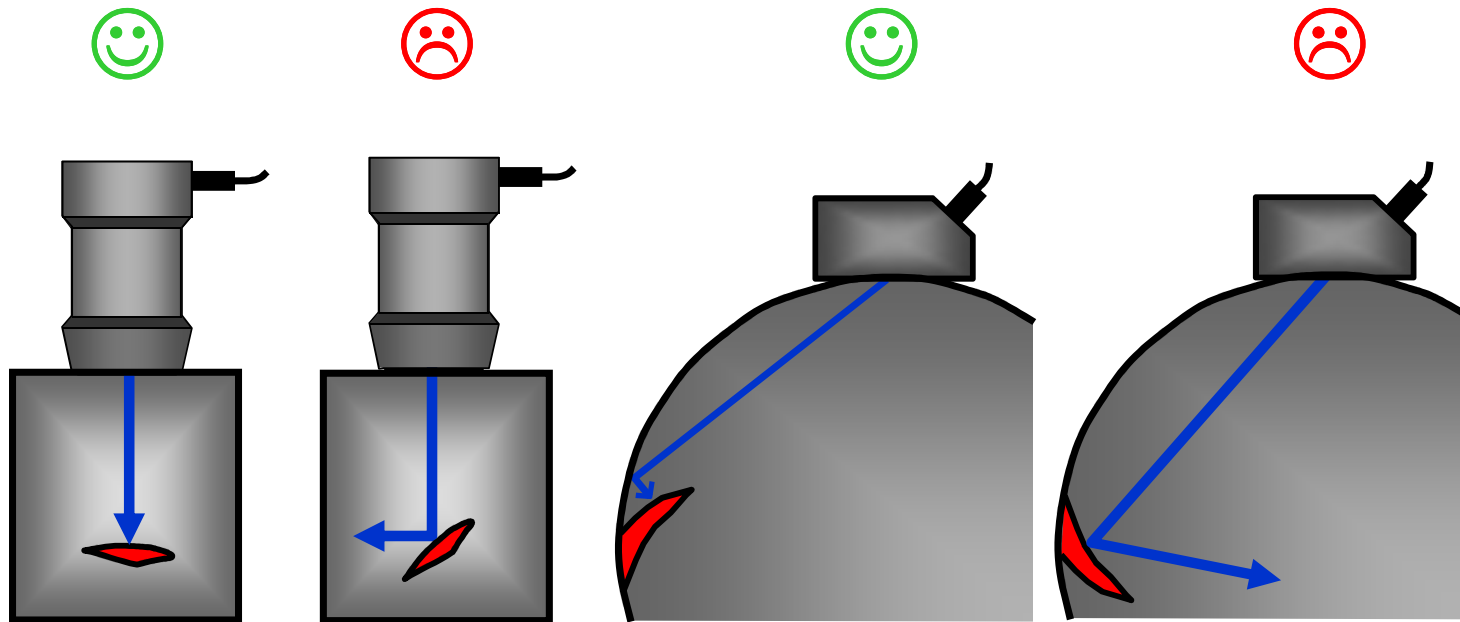

Principles of UT inspection

Principles of UT inspection

Ultrasonic Reflection from Defects

ECHOGRAPH Ultrasonic Probes

Criteria of Choice:

- frequency (material, penetration depth, sensitivity)
- probe size (intensity)
- incidence angle (application)
- width of sound field, focus

Sound Field Characteristics

Reflection and Diffraction

Snells Law Calculations

Incident Material	Perspex	
Velocity km/s		
Compression	2,68	

Refracted Material	Mild Steel	
Velocity km/s		
Compression	5,92	Shear 3,2

Incident: 23

Refracted Comp: 60

Refracted Shear: 28

Phased-Array Probes

- Probe divided into small strips => elements (linear array)
- Every element can be excited individually
- Probes are flexible according:
 - Oscillator size
 - Insonification angle
 - Focussing

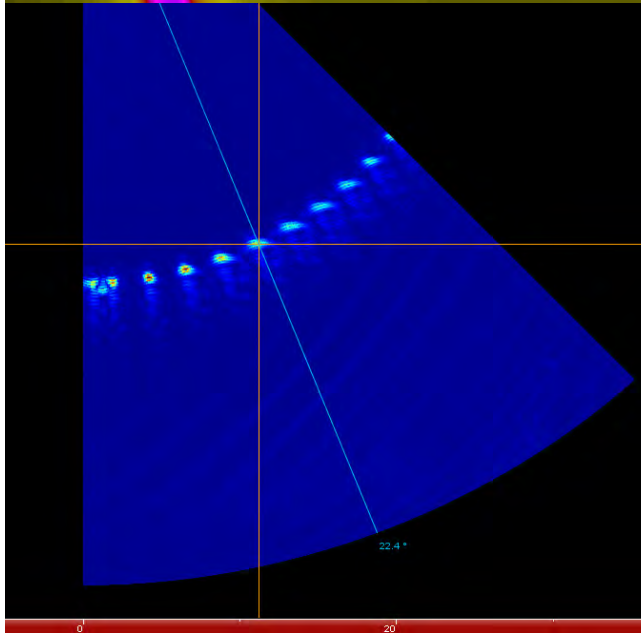

Variation of insonification angle

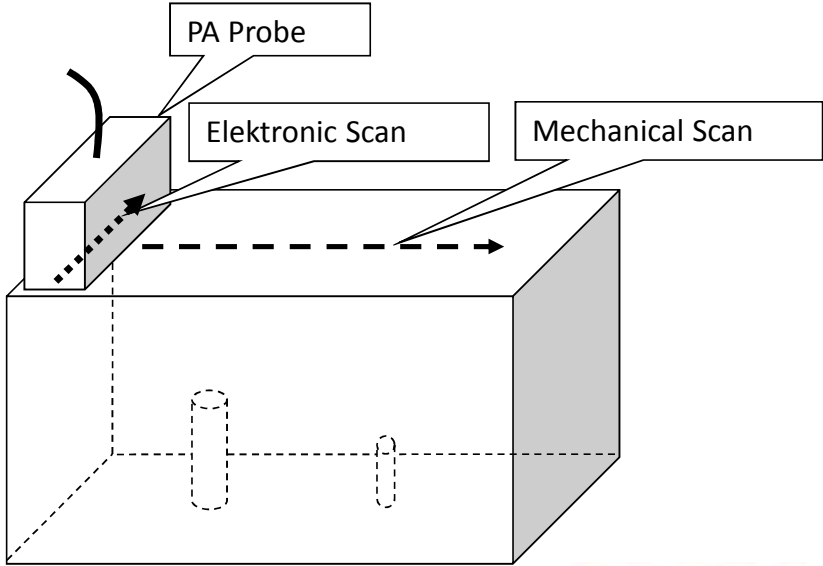

Standard PA-UT methods

Sector-Scan

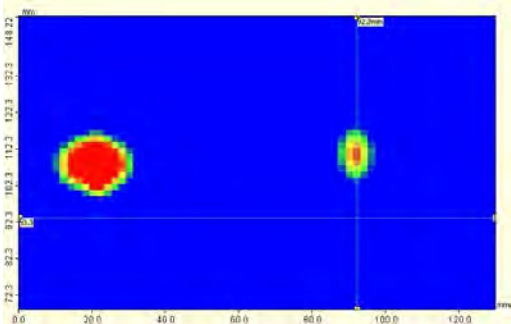

Linear-Scan

Display of results

Top view (C-/P-scan)

B-Scan

Side View (E-Scan)

Elektronical B-Scans (E-Scan)

Full Matrix Capture (FMC)

- Recording of a complete set of A-scans
- Each element is excited one by one while all elements are receiving
- Result: $n \times n$ Matrix of A-scans

Principle of the Total Focusing Method (TFM)

TFM is a post-processing algorithm for FMC data.

- Discretion of an inspection area to a grid
- Creation of an artificial focus at all points of the grid by summation of the FMC data

Advantage:

- Inspection area may be wider than the probe
- Focussation within the complete inspection zone

Soundfield of a single element

- CIVA simulation of a probe with 10 MHz, 64 elements, 0.3 mm pitch, 0.05 mm gap
- Wide soundfield
- Probe „looks“ into all directions

What TFM can do

- Sample: ASTM E2491 Phased Array Test Block Metric 7075-T6 Aluminum
- Instrument: GEKKO
- Probe: 10 MHz, 64 elements, 0.3 mm pitch, 0.05 mm gap

What TFM can do

B-scan

Focussed

Total Focusing Method

Distinctiveness of UT testing on aluminum

Distinctiveness

Special characteristics of aluminum in terms of UT inspection are:

- Relatively high sound velocity of L-waves (6.400 m/sec) and relatively low sound velocity of T-waves (3.100 m/sec)
=> angle inspection with T-waves can go down to 30° without having an L-wave
- Relatively low sound attenuation => pulser voltage on steel might be ok but leads to over-saturated signals on aluminum
- Inhomogenous sound velocity on rolled parts
- Grain size influences sound attenuation

Inspection of welds on thin plates with complex geometries

Thin plates

KARL DEUTSCH

Thin plates

Thin plates

Probe 16 Elements,

Interpretation

Interpretation

Inspection of casted aluminum plates

Inspection setup

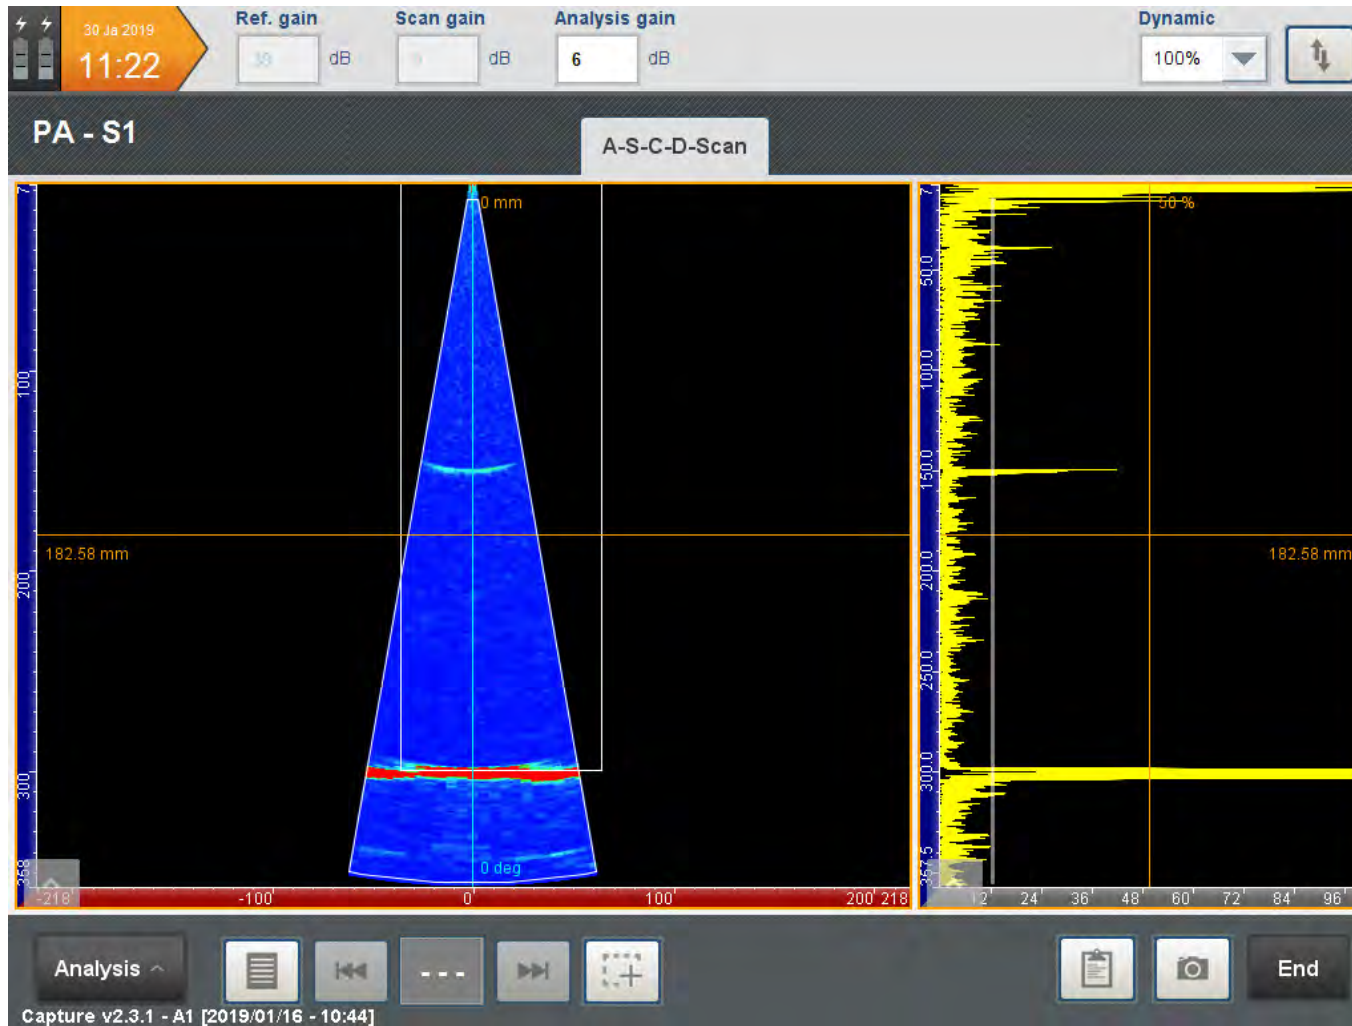

Probe with 5 MHz,
0,85 mm pitch
10 mm elevation
Watergap 1 mm

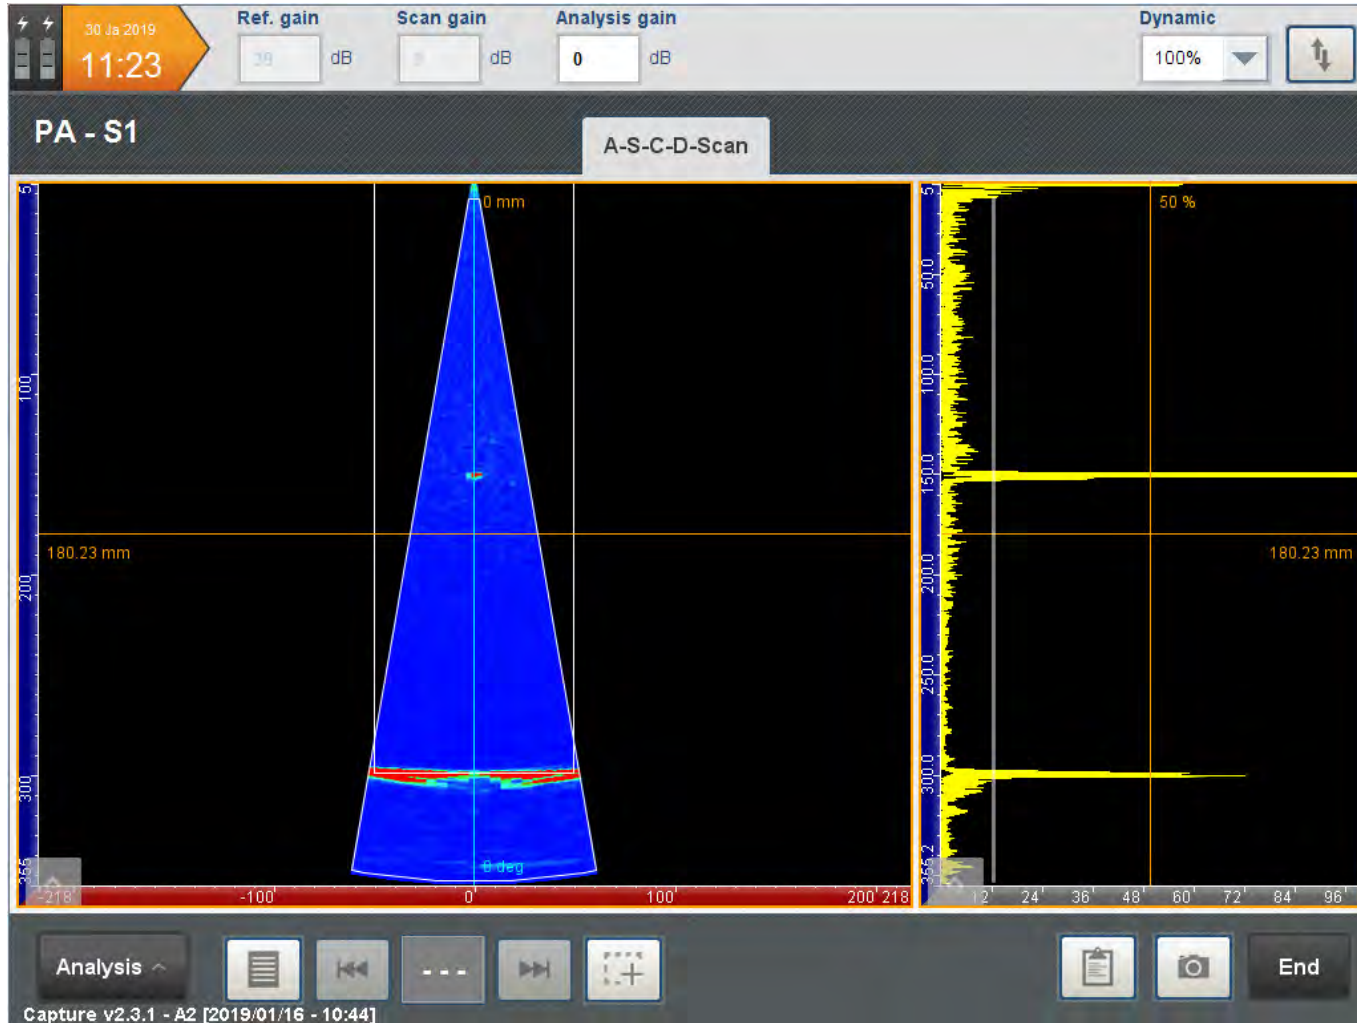

Without focussation

FBH 2,5 mm
at 150 mm
unfocussed
Sector Scan
-10° to +10°

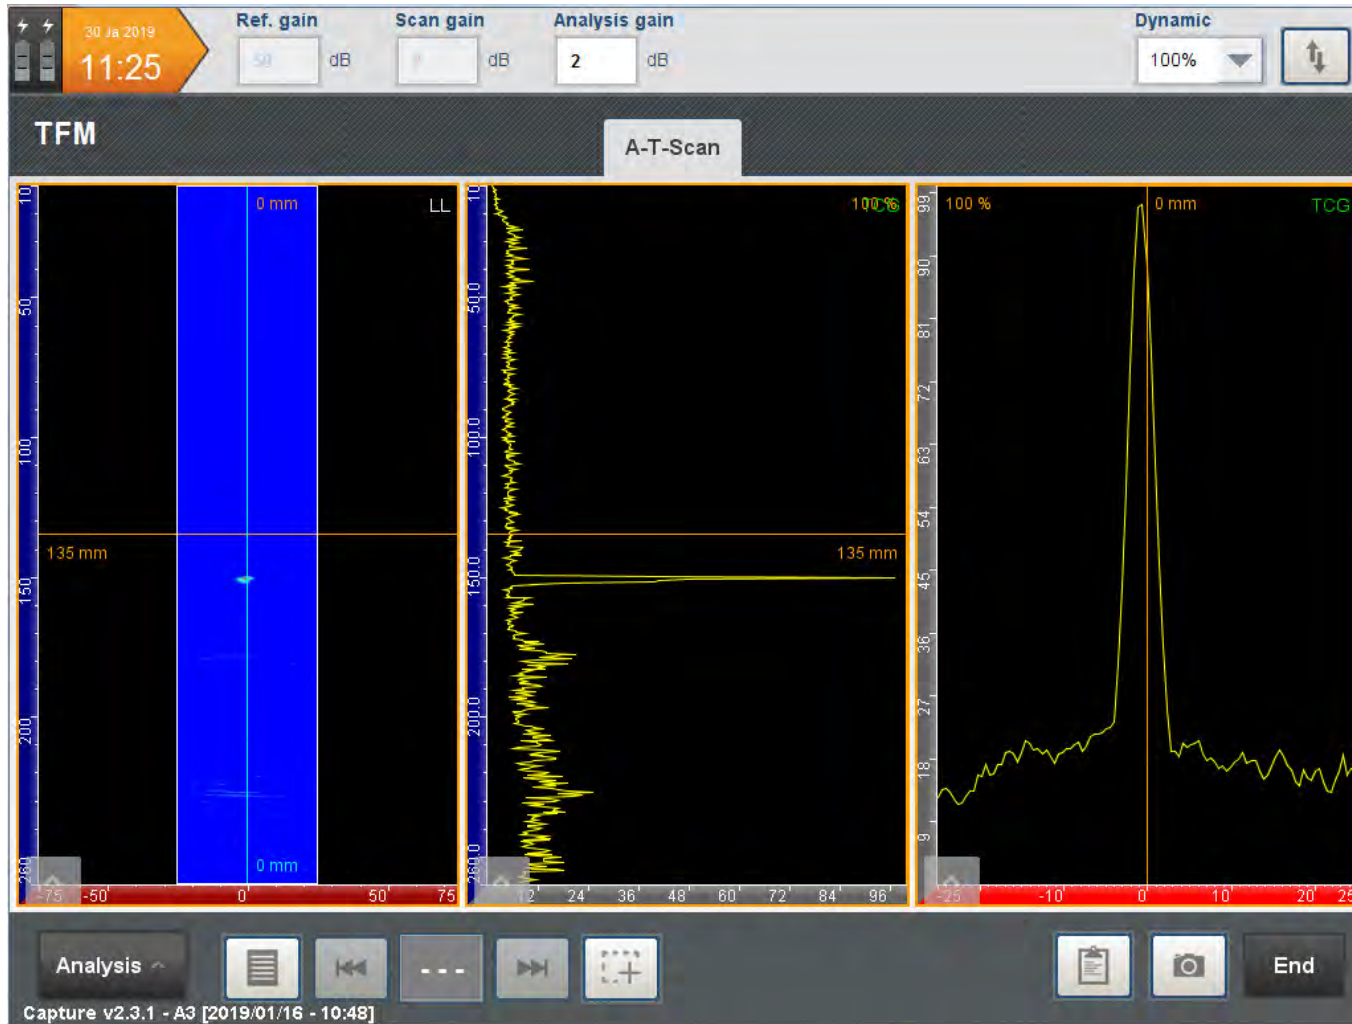

With focussation at 150 mm

FBH 2,5 mm
at 150 mm
focus at 150 mm
Sector Scan
-10° to +10°

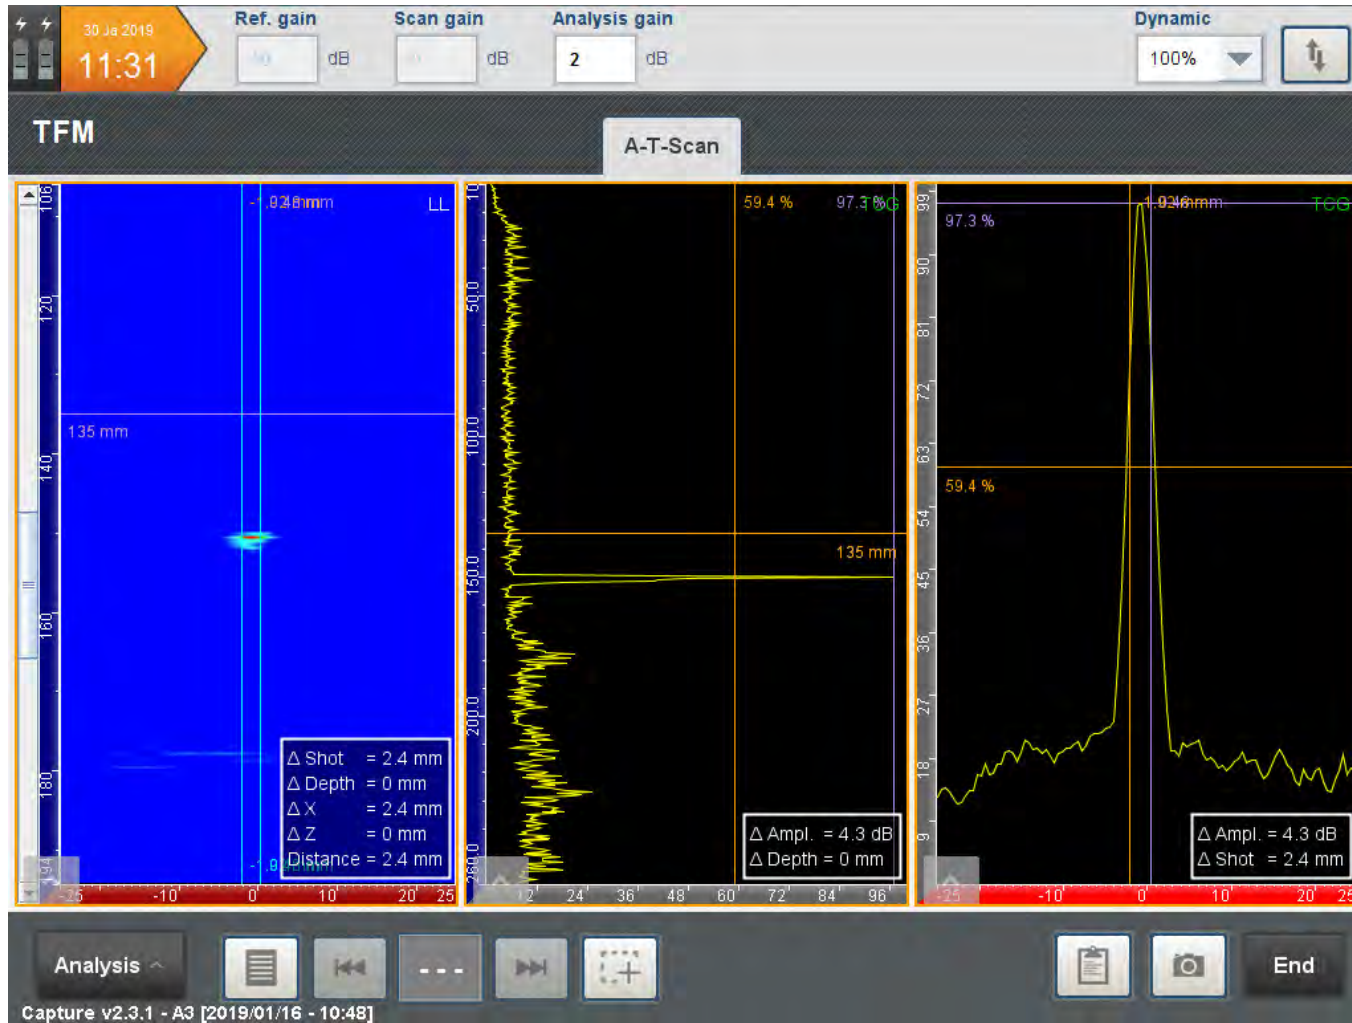

All area focus with TFM

FBH 2,5 mm
at 150 mm
TFM scan

Evaluation of the defect size

FBH 2,5 mm
at 150 mm
TFM scan

Evaluation of the defect size

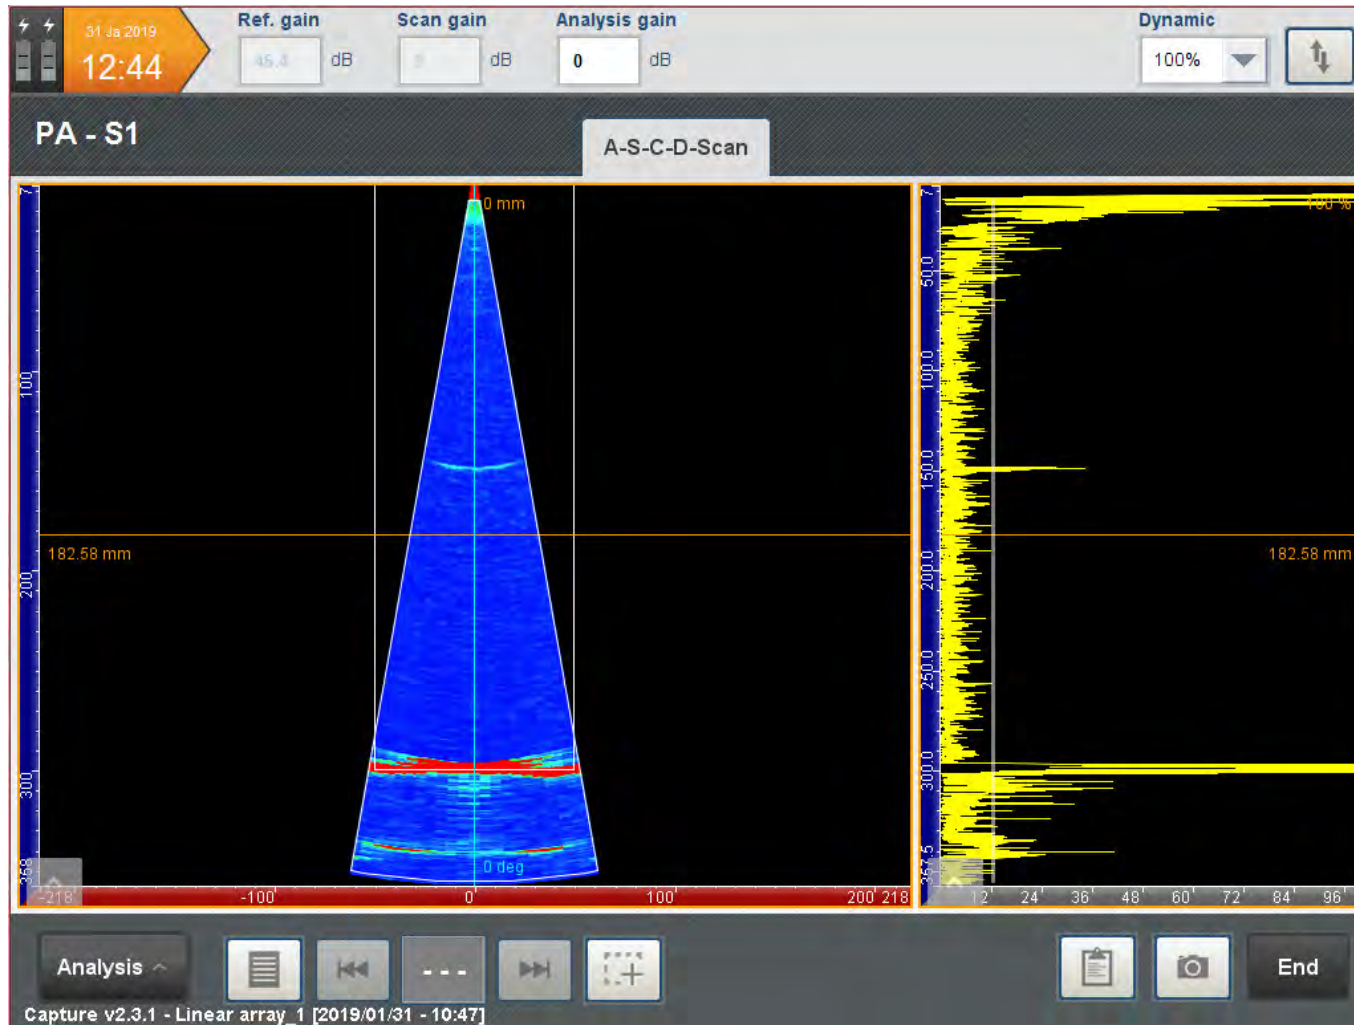

Testblock with same dimensions, FBH 1,8 mm at 150 mm and 250 mm

Conventional UT with ECHOGRAPH 1095 and probe S 24 HB 4

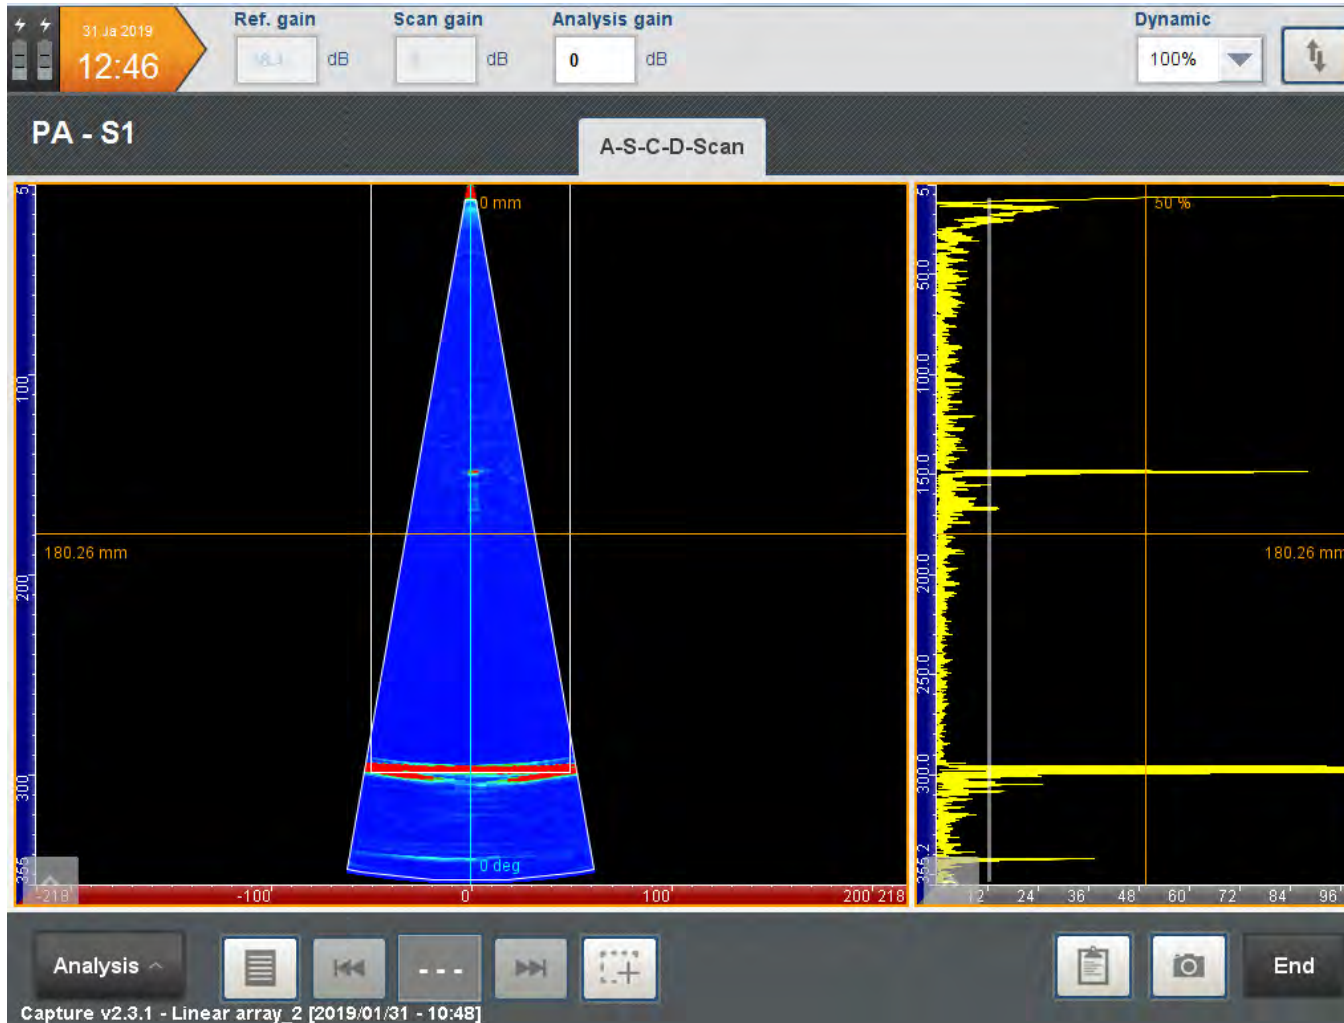

Without focussation

FBH 1,8 mm
at 150 mm
unfosussed
Sector Scan
-10° to +10°

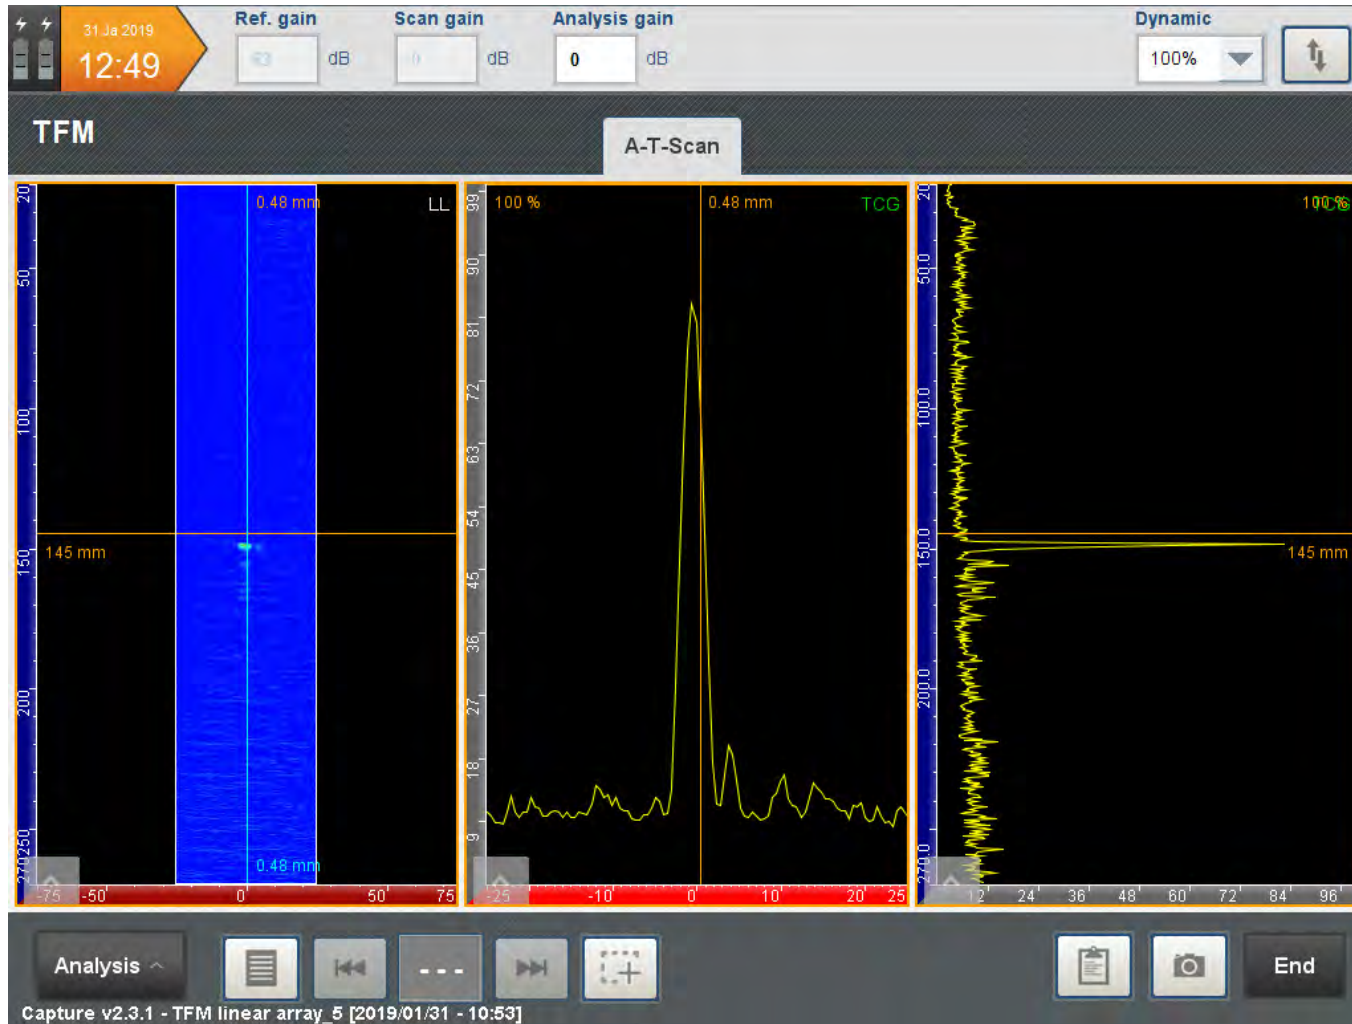

With focussation at 150 mm

FBH 1,8 mm
at 150 mm
focus at 150 mm
Sector Scan
-10° to +10°

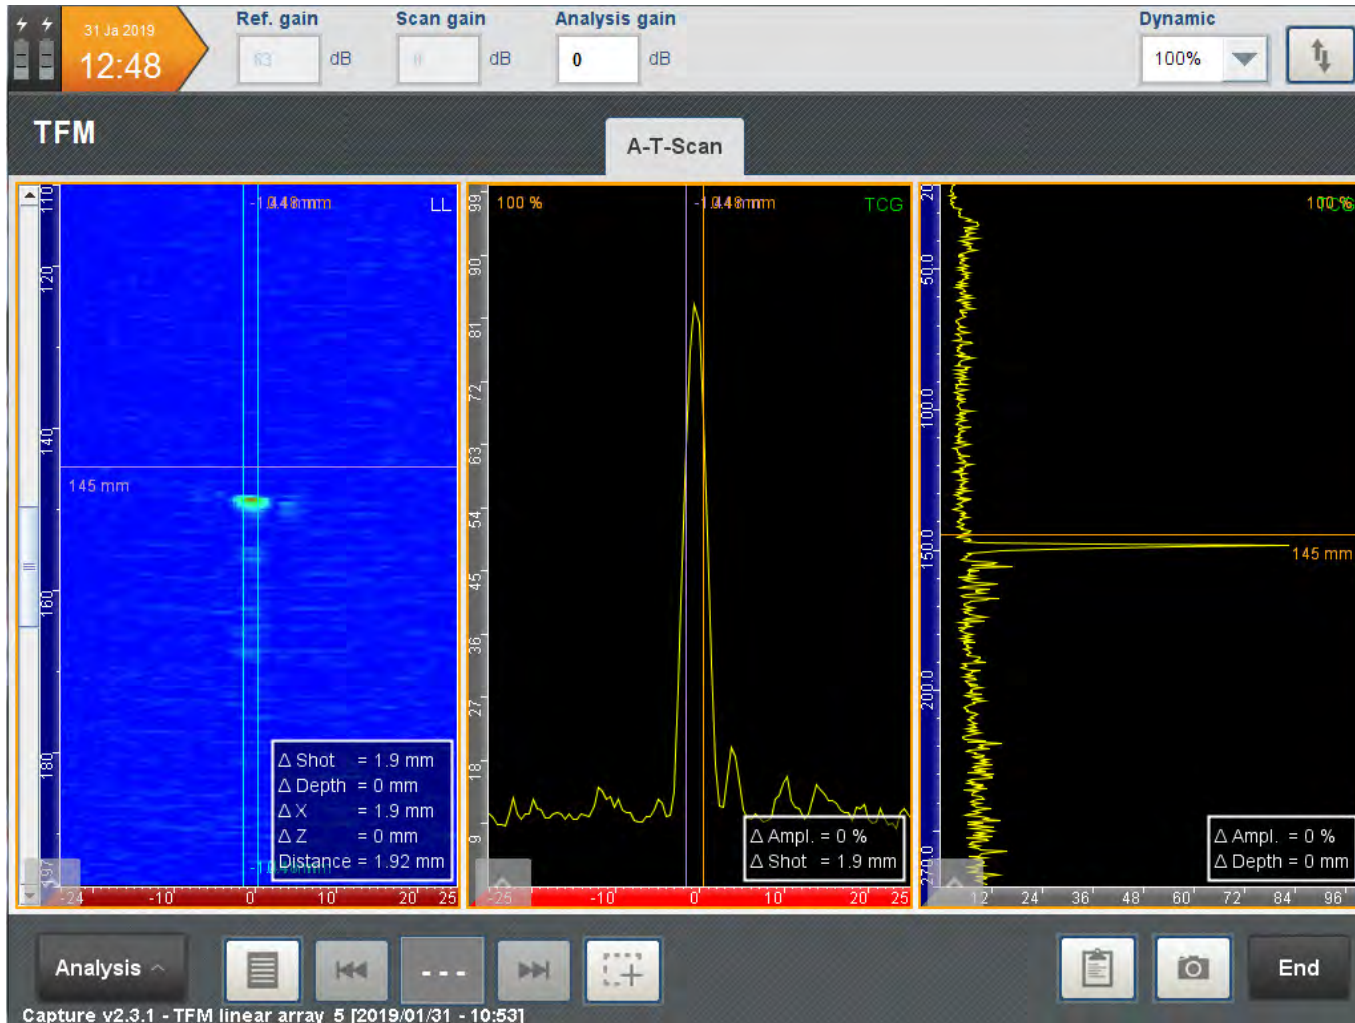

All area focus with TFM

FBH 1,8 mm
at 150 mm
TFM scan

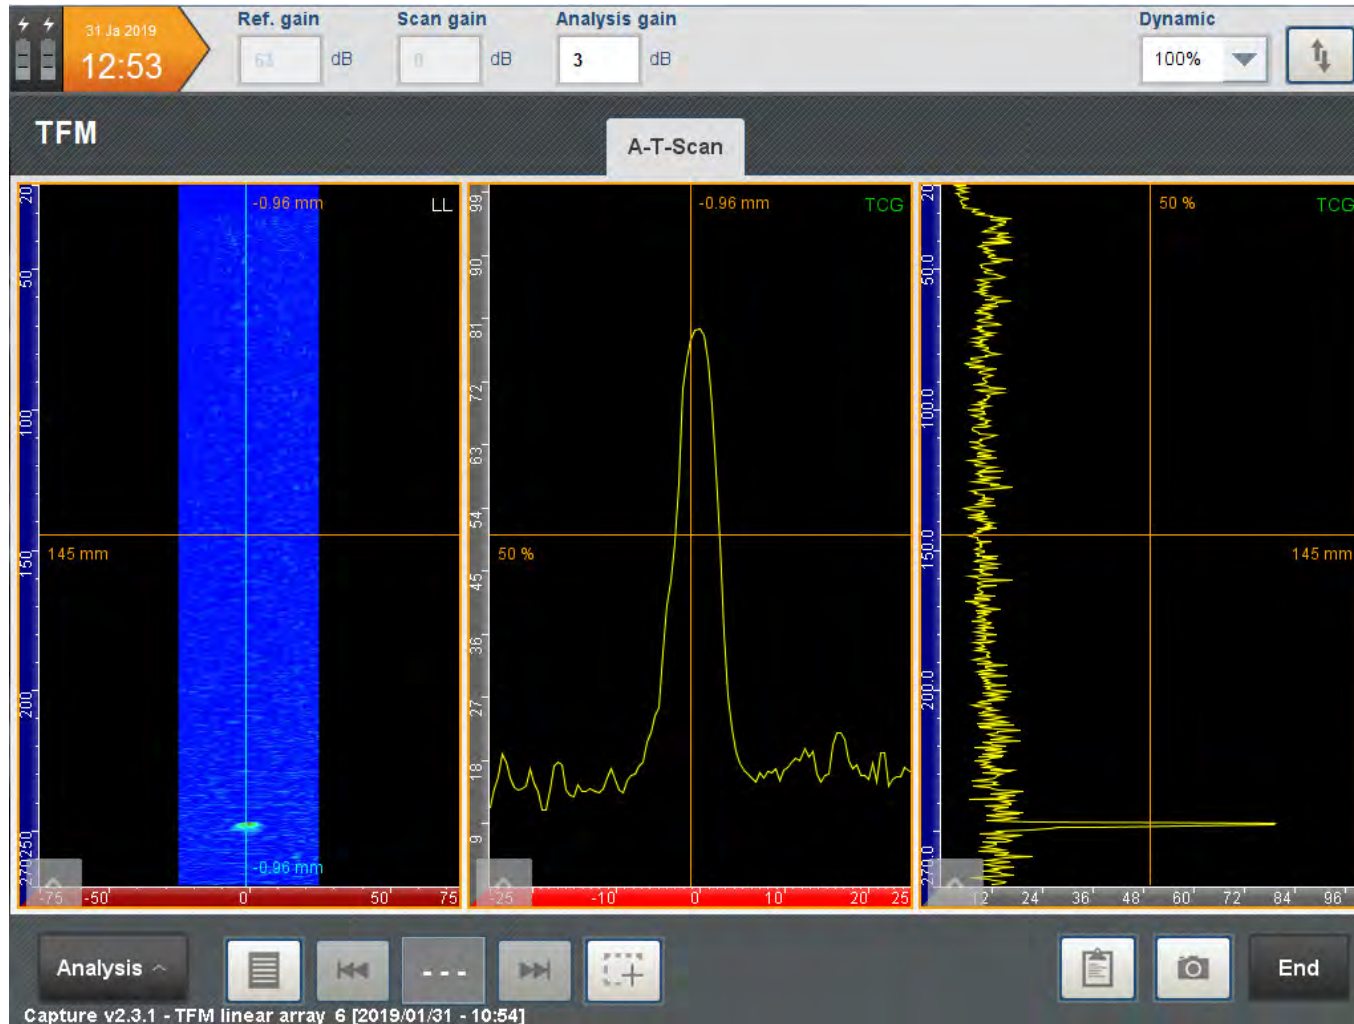

Evaluation of the defect size

FBH 1,8 mm
at 150 mm

Integrated precision measurement of wall thickness

Sonic Eye by Starrag

Multi-axis grinding machine for large vertical parts

Sonic Eye by Starrag

Sonic Eye as a changing tool
Automatic thickness measurement,
measured data directly influence
the grinding process

Inside Sonic Eye

Special Version of
standard precision
wall-thickness gauge
ECHOMETER 1077 with
probe DS 12 PB 1-7

KARL DEUTSCH

Inspection of spotwelded aluminum plates

Spotweld inspection

Spot welding is useful as it can produce high quality welds at a relatively low cost

About 3.000-5.000 spots on a regular car body

Welding Process

1. Pressure applies to assure full sheet contact
2. Heat melt the steel to form the nugget weld

The Result

KARL DEUTSCH

The challenge

Weld quality is impossible to predict visually from the outside

Some nugget types

- Good
- No Weld (Loose)
- Undersized

Spotweld inspection with UT/Mate

KARL DEUTSCH

Spotweld inspection - probes

Probes have to be selected according to the nominal nugget size

Spotweld inspection – basic principle

OK

NOK

Spotweld inspection – basic principle

- Good spot

- Spot too small

- Cladding

- No weld

Spotweld inspection – basic principle

- Good spot

- Spot too small

A pore in the spot center may give the same signal but is not critical

- Cladding

- No weld

Spot welded aluminum plates often show such pores

Spotweld inspection with PA UT/x

Phased-Array-Technique is applied in UT/x

- Matrix-Probe with 61 Elements
- Only one probe required
- PA-Electronic MANTIS
- Weld nugget is evaluated
- Welded area is measured
