

“Innovative Aluminum Lightweight Technologies for Aerospace Application”

Dr. Blanka Lenczowski / Airbus Group Innovations, Munich

AMAP Colloquium

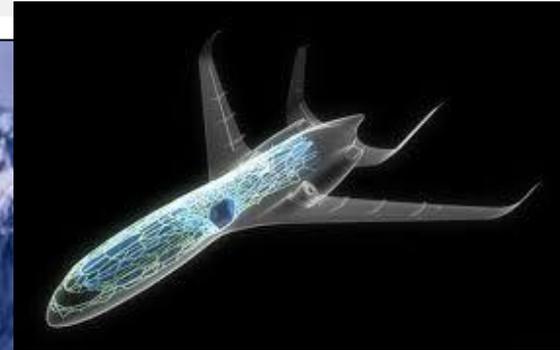

October 6th 2016

Aachen

AIRBUS
GROUP

The drivers for future structure

- Increased performance
- High quality and reliability
- Increased efficiency
- Reduction of weight
- Sustainability (eco-efficiency)
- Cost Reduction !

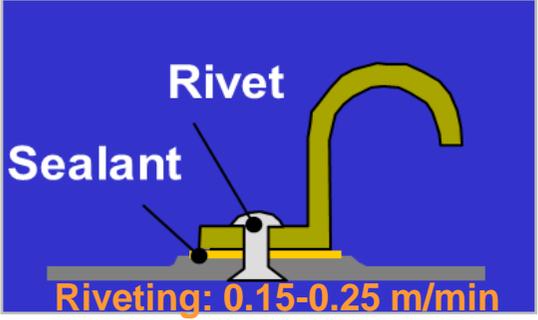

- ➔ Innovative design principles
- ➔ Advanced process
- ➔ New material concepts

Requirements for new alloys:

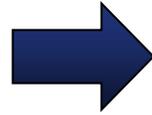

- Low density
- Improvement of damage tolerance (DT)
- Good combination of strength & DT
- Good weldability
- High resistance to corrosion

New advanced technologies & materials

Traditional Joining
Differential Design

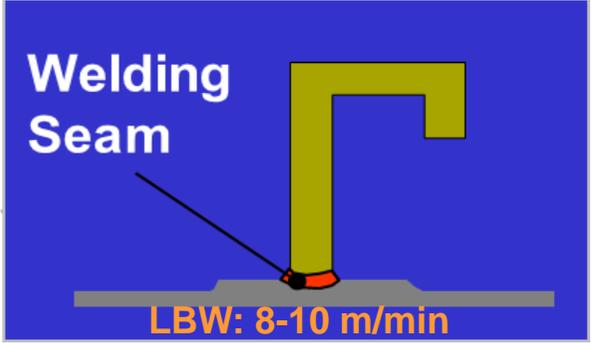

Rivet
Sealant
Riveting: 0.15-0.25 m/min

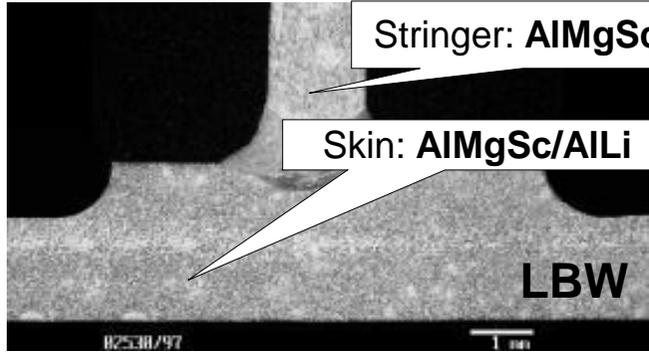

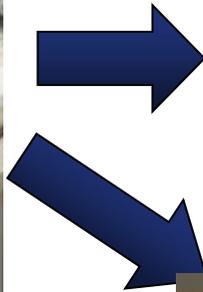

New Metallic Fuselage: *Integral Structure*

- Cost Reduction 25%
- Weight Reduction 10%
- Improved Corrosion Behaviour

Welding Seam
LBW: 8-10 m/min

New approach → Welding of Mono/Mixed Materials

Stringer: AlMgSc/AlLi
Skin: AlMgSc/AlLi
LBW

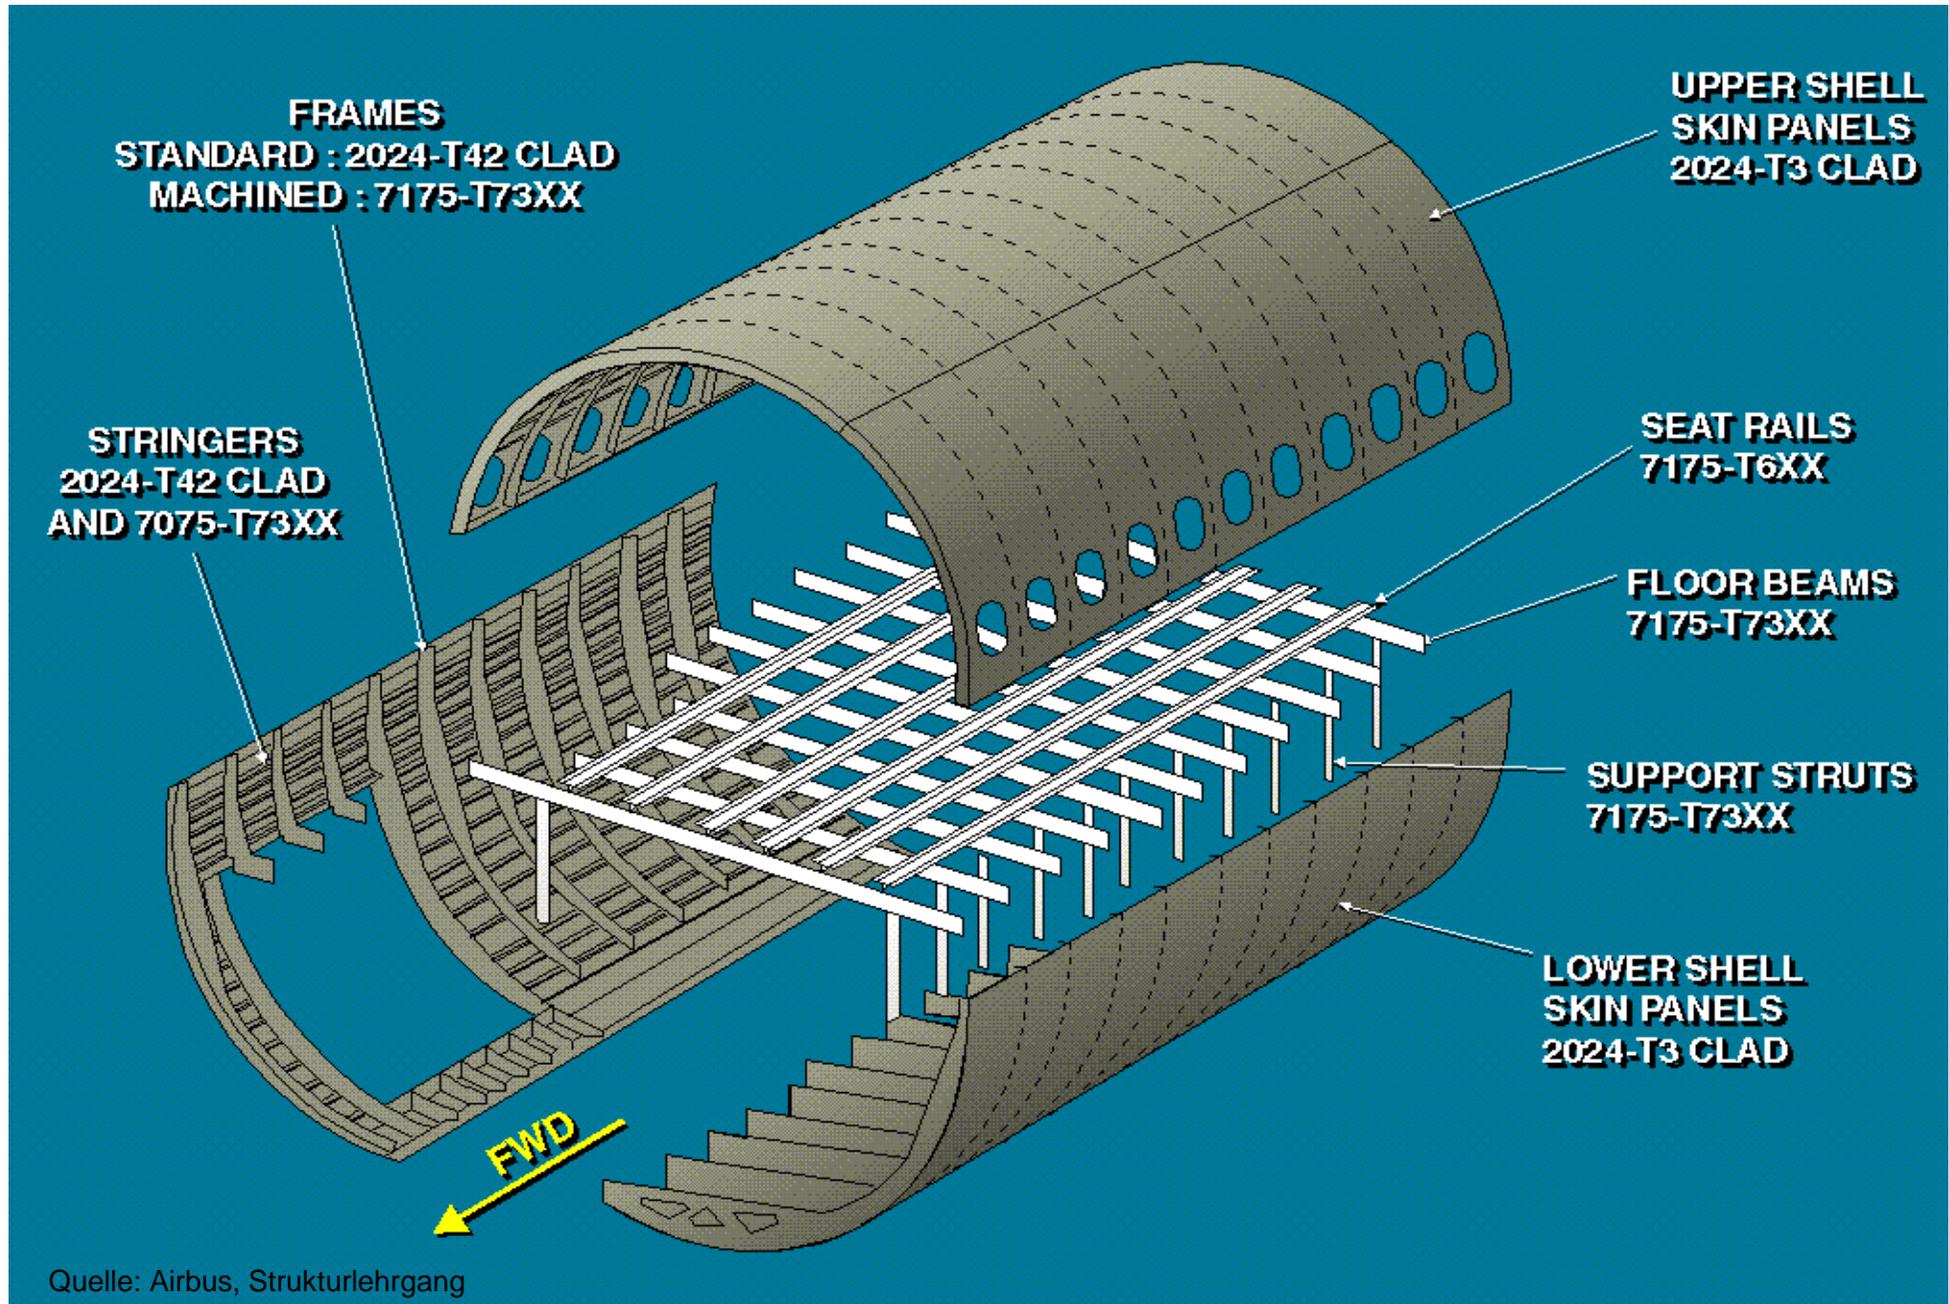

FSW

Target → New weldable alloys for HDT Al-Structures

Material and technology evolution: A320

Al-Mg-Sc alloy

Status

- » Corus alloy (**Ko8242/5024**) → Developed in national funded BMBF-Project (1996-1999) under leadership AGI IW Munich

Motivation

- » 5% lower density compared to AA2024/AA2524 and 2.5% lower than AA6013
- » Excellent corrosion resistance (no IGC, EXCO & SCC sensitivity)
- » Excellent fusion weldability (no hot crack sensitivity)
- » Excellent creep or relaxation formability at 300-350°C
- » During relaxation process increase of strength in LBW fusion zone up to base material level

Ingots

Hot rolling

Unrecrystallised after
creep form anneal

Quelle: Aleris

1996-1999 BMBF-Project with VILS → 1999 - 2011 industrialization Ko8242/ AA5024
Today → Improved AA5028 (Aleris)

Al-Mg-Sc alloy

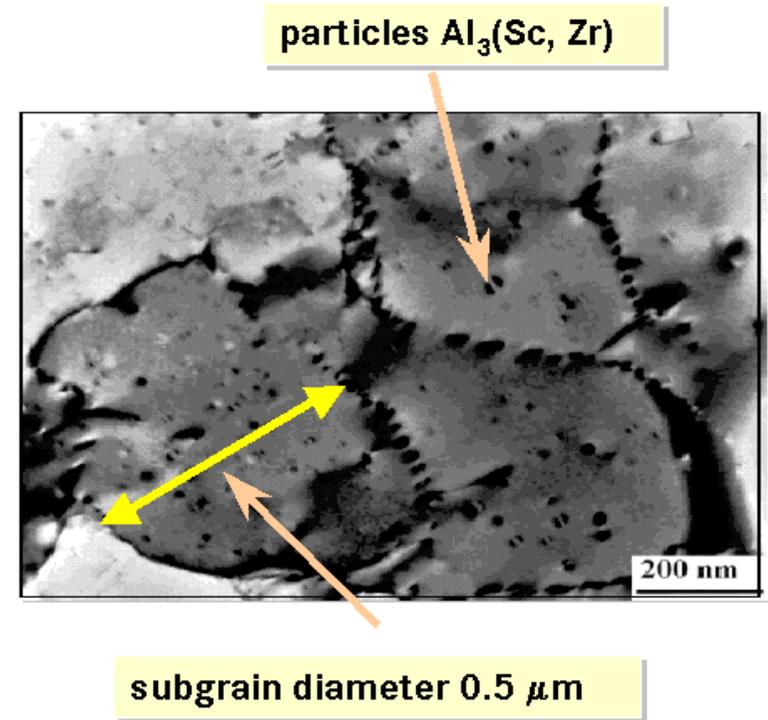

Metallurgical principles of scandium addition

I. Effects of Scandium Al_3Sc :

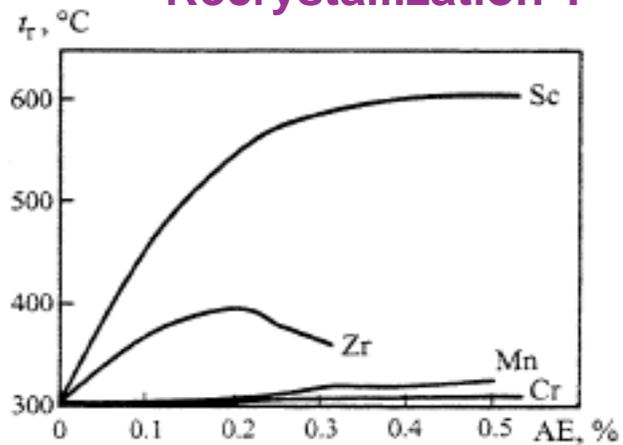

- » Grain refinement (casting & welding)
- » Strengthening
- » Recrystallization inhibition

II. Effect of Scandium & Zirconium $Al_3(Sc,Zr)$:

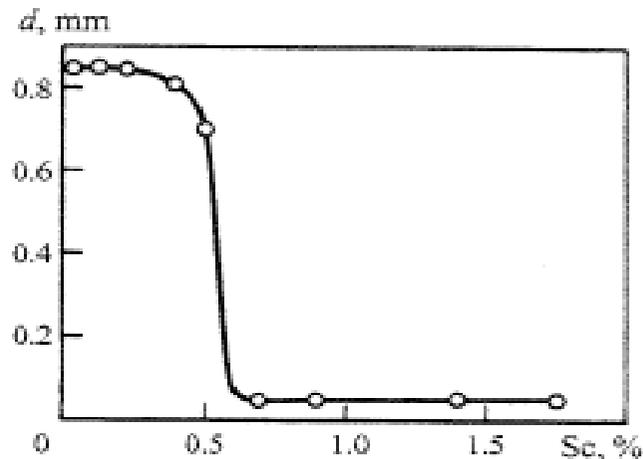

- » Lower tendency to coagulate
- » Higher anti-recrystallisation and strengthening effect

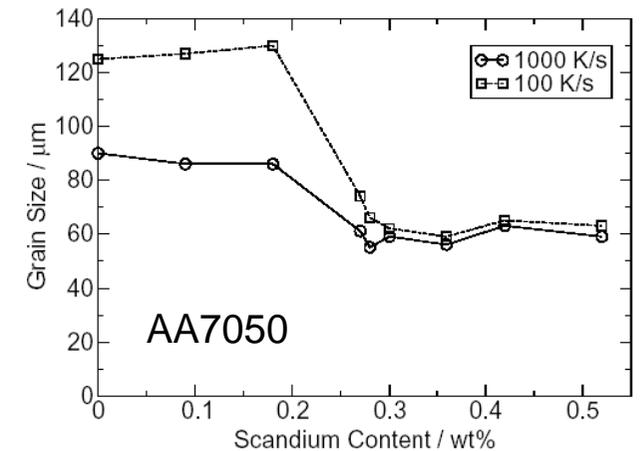

Recrystallization T

Grain size

Colling rate

New advanced technologies & materials

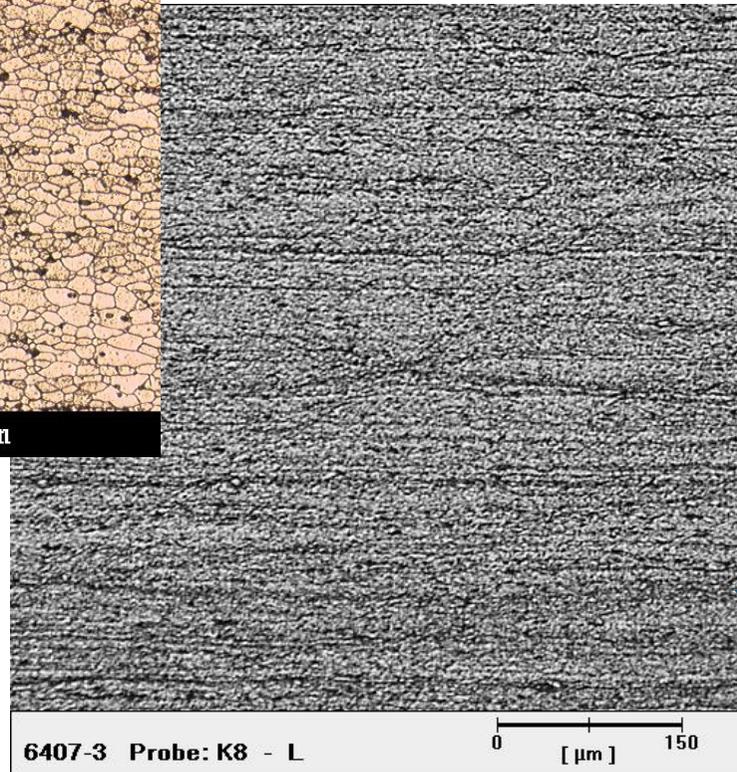

Microstructure

6013-T651

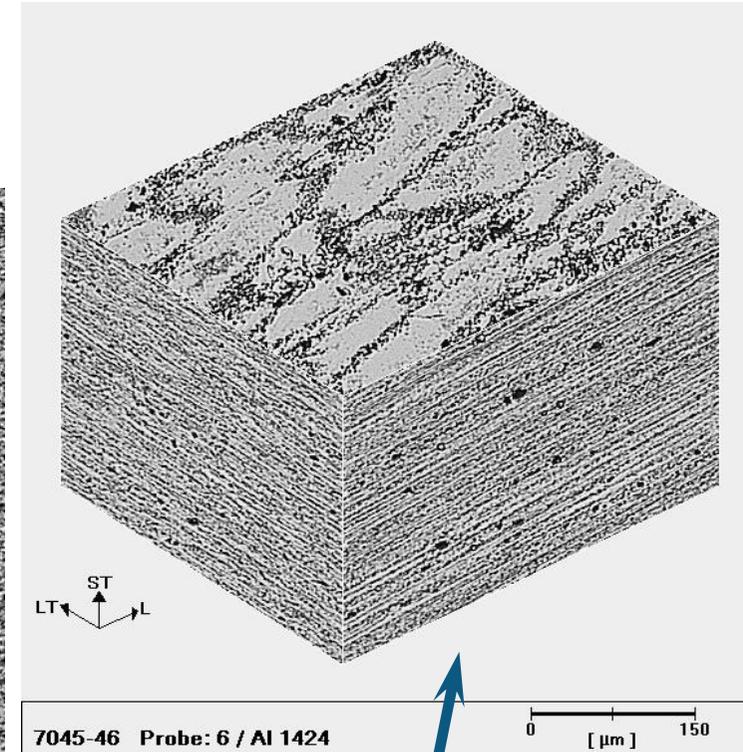

Recrystallized structure

5XXX+Sc-TX

1424-3TX

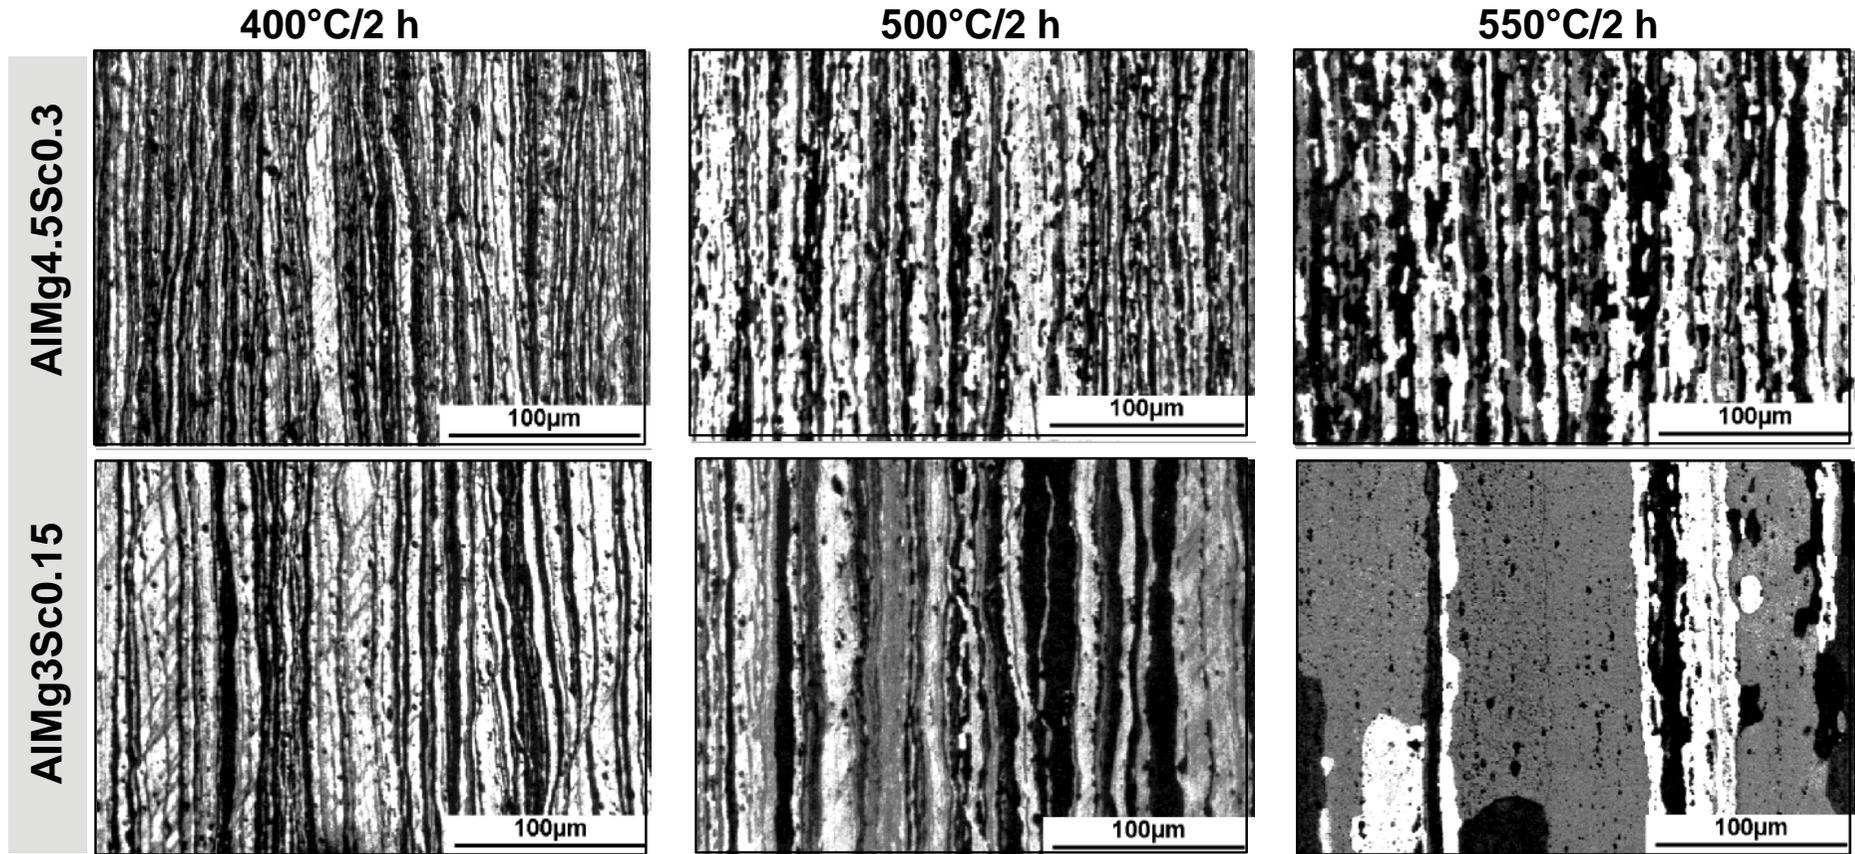

Non-recrystallized structure

Al-Mg-Sc alloy

Al-Mg-Sc microstructure evolution → Impact of temperature

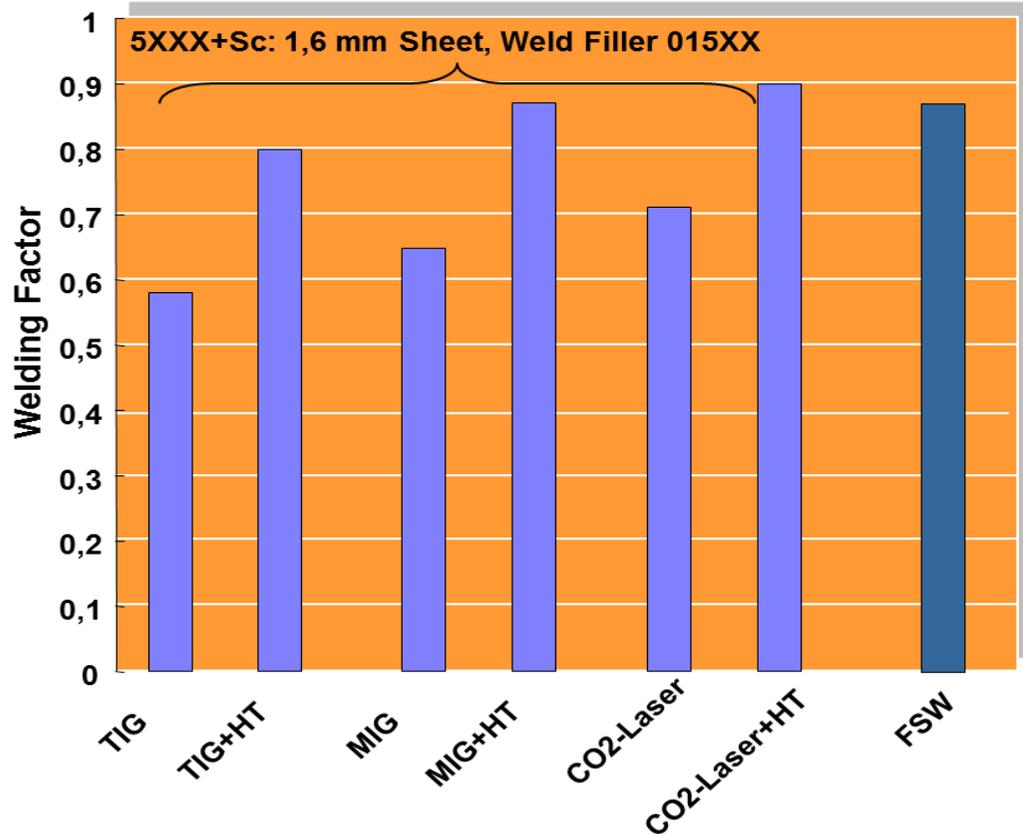

Conventional casting

~10 -100 K/s

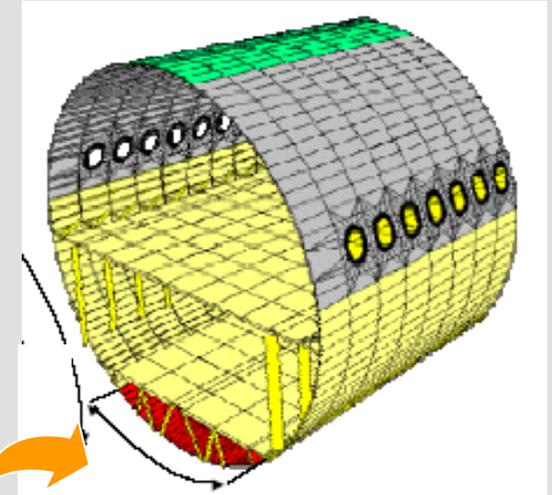

Al-Mg-Sc alloy

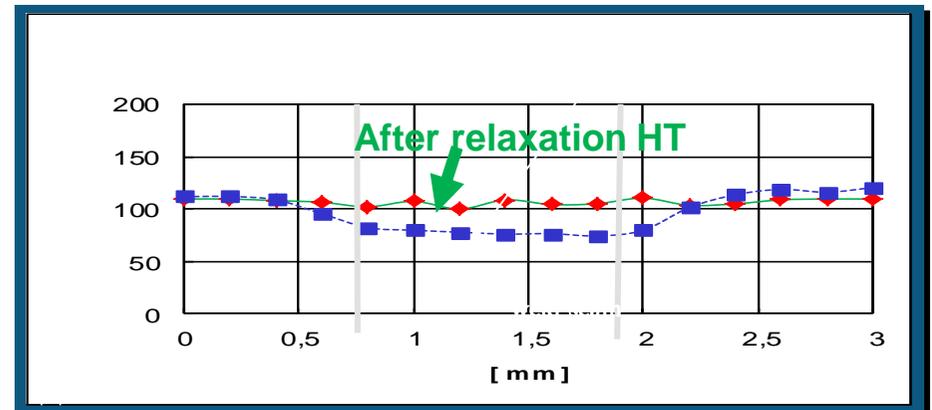

Weldability

Al-Mg-Sc shells in TANGO Barrel

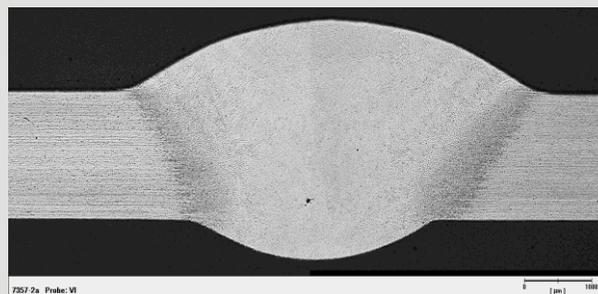

Al-Mg-Sc Skin (inc. FSW)
Al-Mg-Sc LBW Stringer

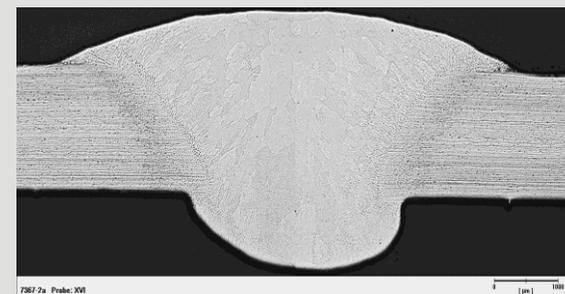

Excellent weldability!!!

Type of welding impacts the welding factor due to the cooling rate!!!

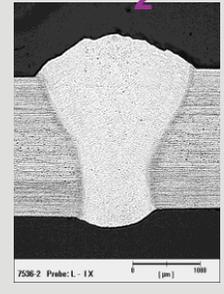

TIG

MIG

CO₂

Al-Mg-Sc alloy

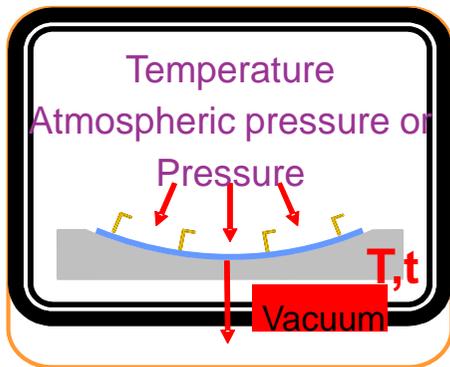

New forming technologies: Creep Forming of welded parts

1. Stringer LBW

2. Fixing the panels in the form

3. Creep forming

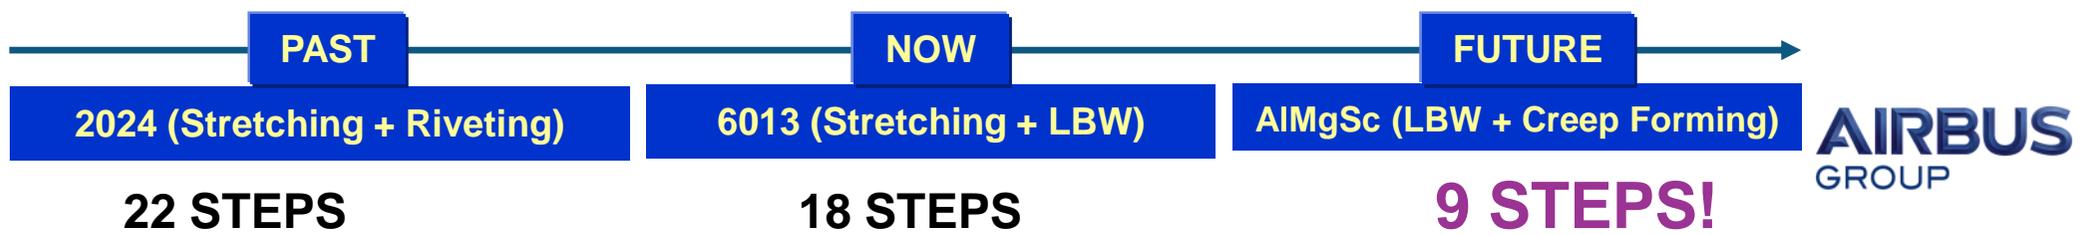

4. Ready

Advantages:

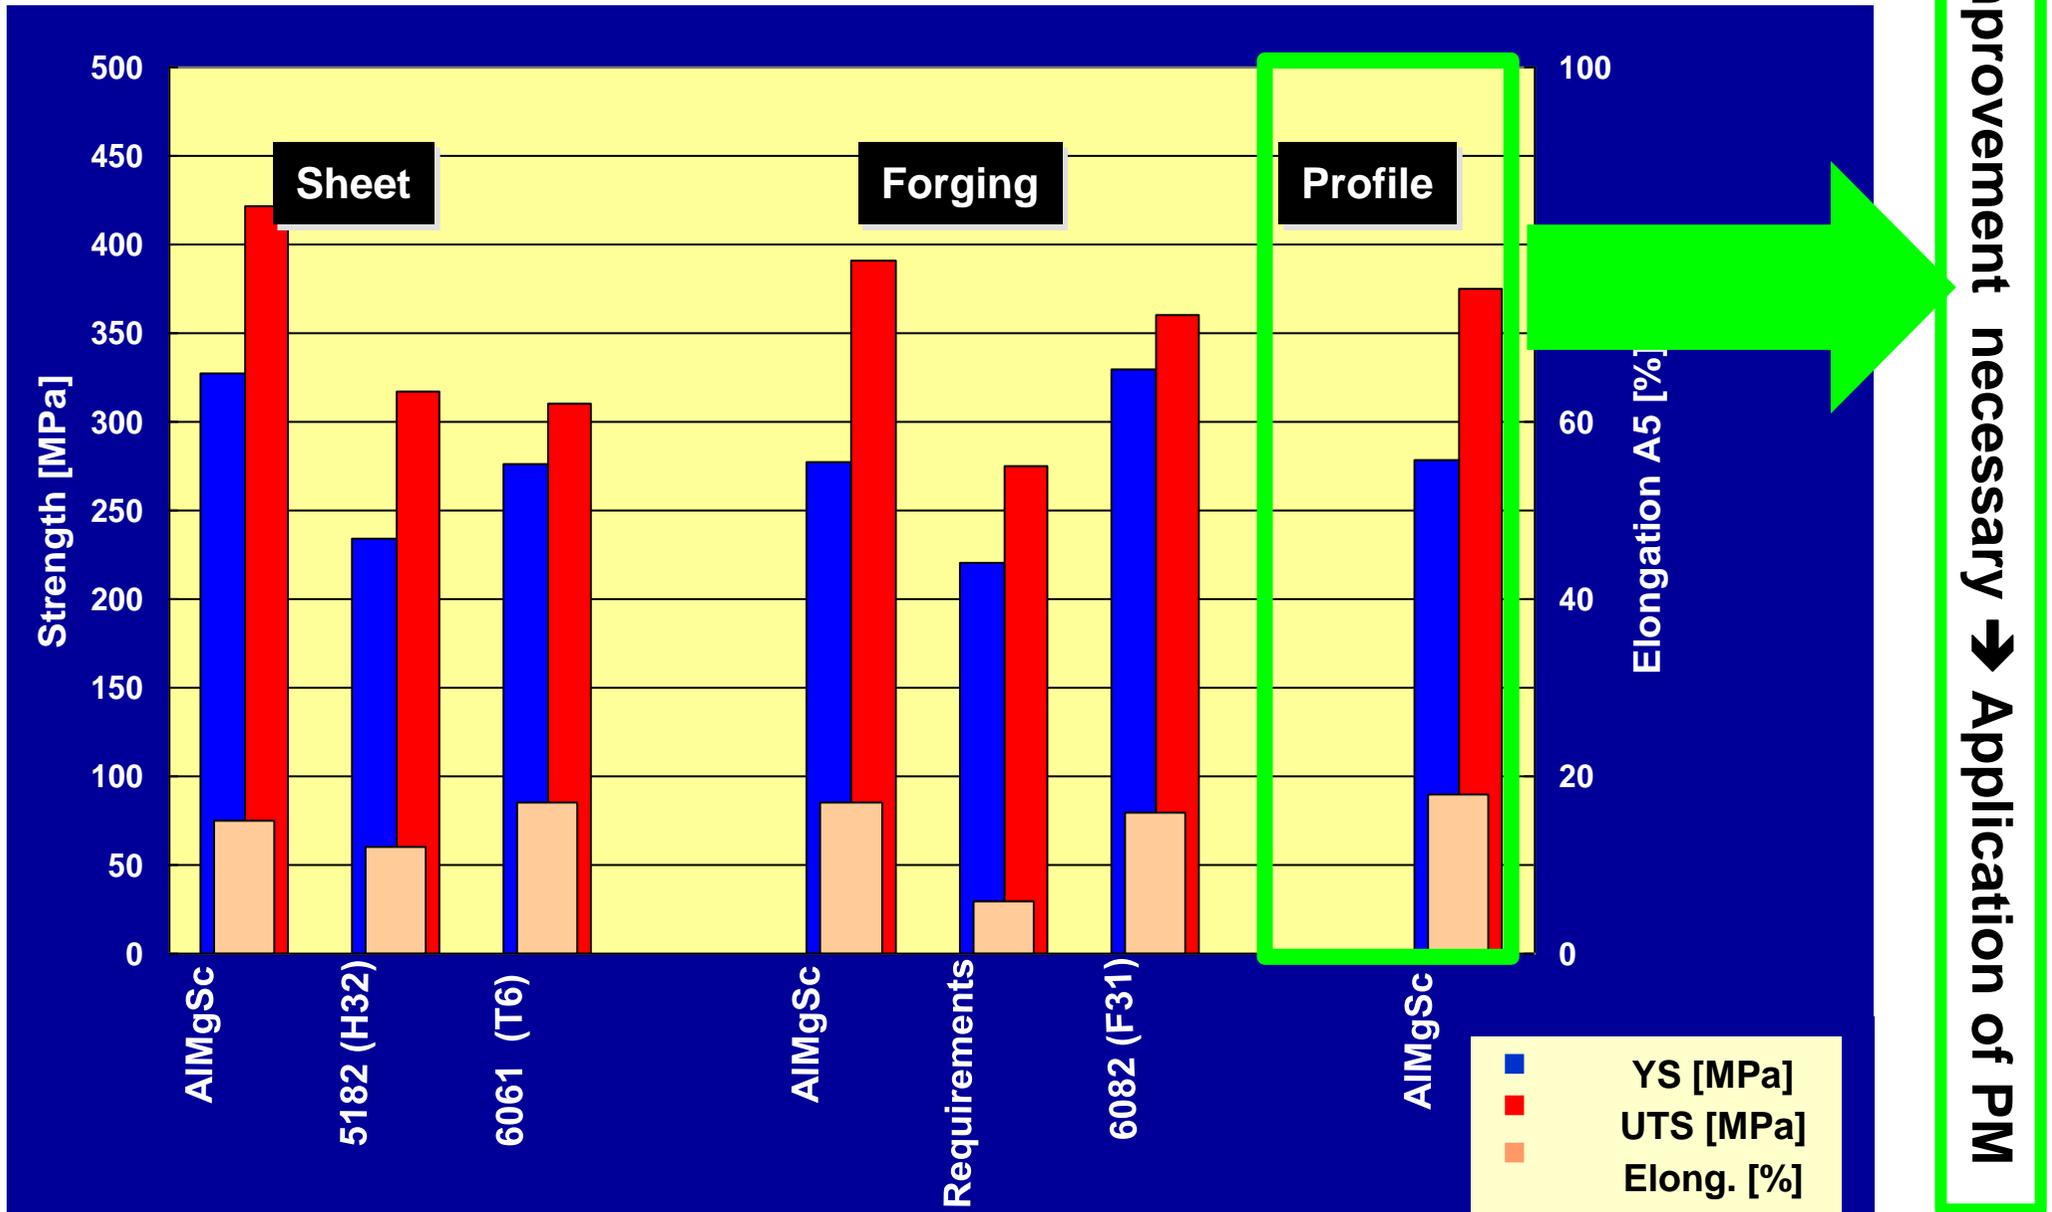

- LBW on flat sheet
- No spring-back
- Hardening of joint & HAZ
- Relaxation of residual stresses and distortions

Innovation → Reduction of costs through reduction of manufacturing steps

Al-Mg-Sc alloy

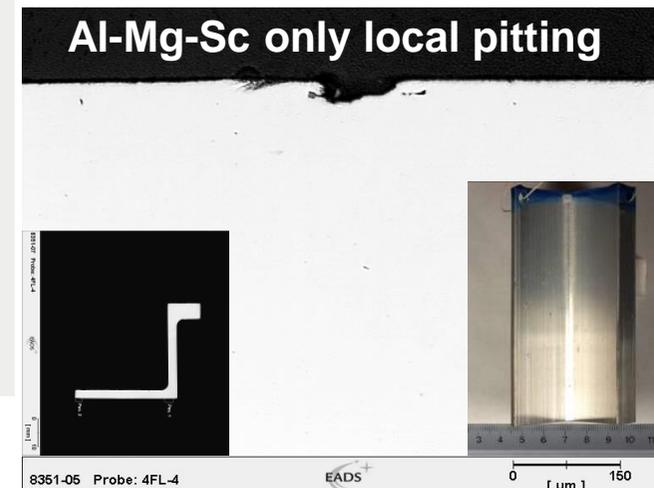

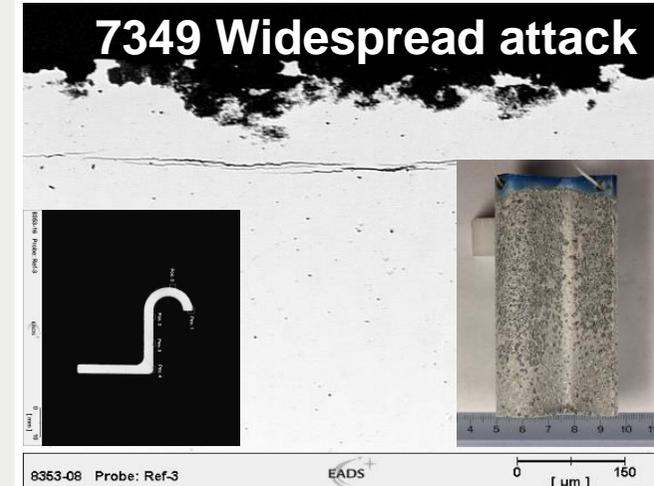

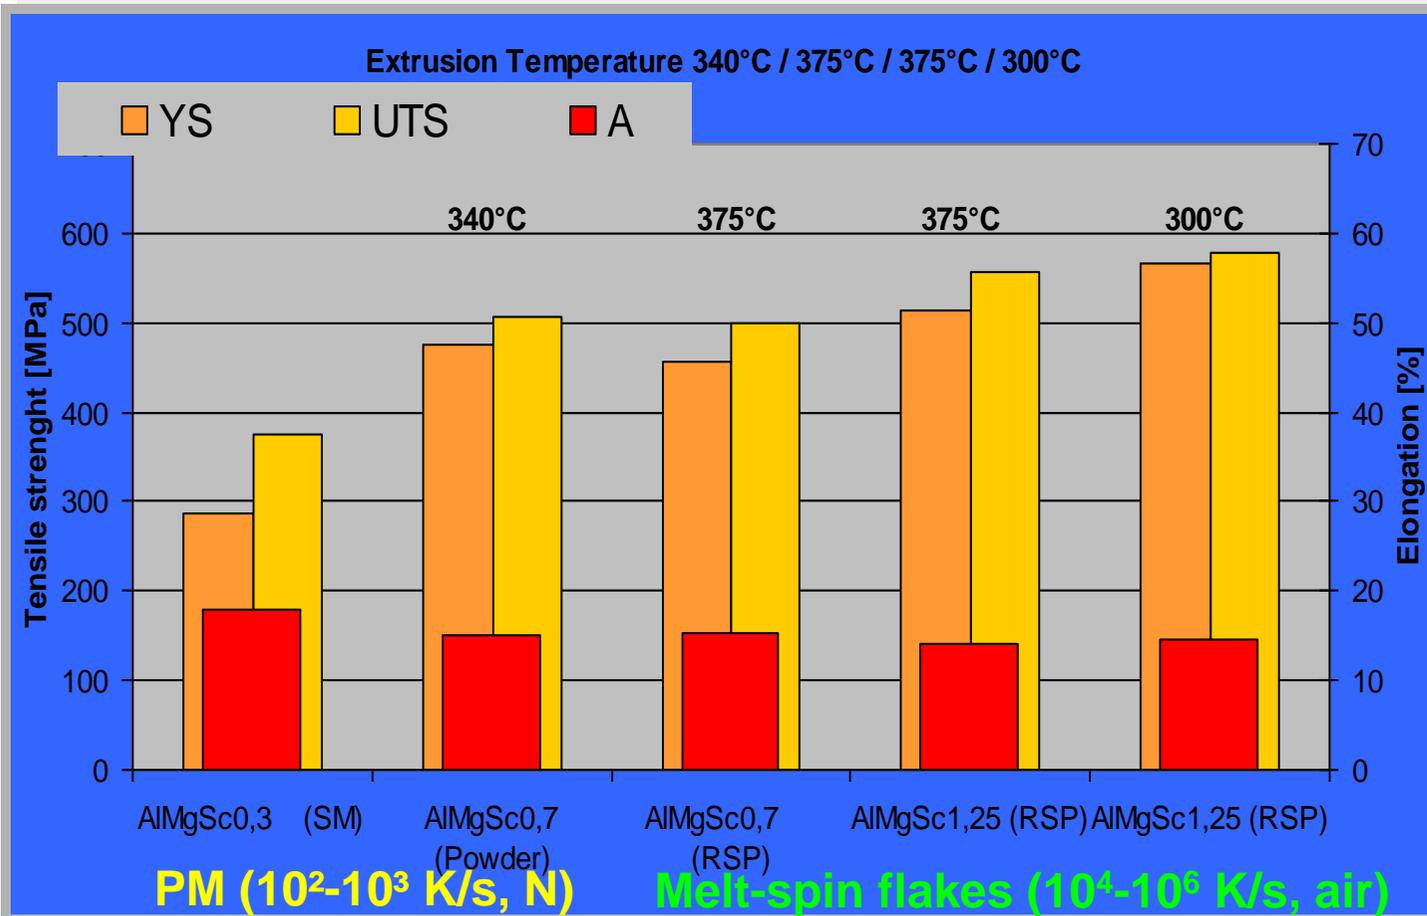

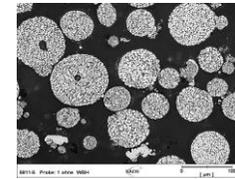

Mechanical Properties of Different Al-Mg-Sc Semi-Finished Products

Scalmalloy®: AGI' second-generation Al-Mg-Sc material

Development of high strength PM Al-Mg-Sc material

Mechanical properties & corrosion behaviour

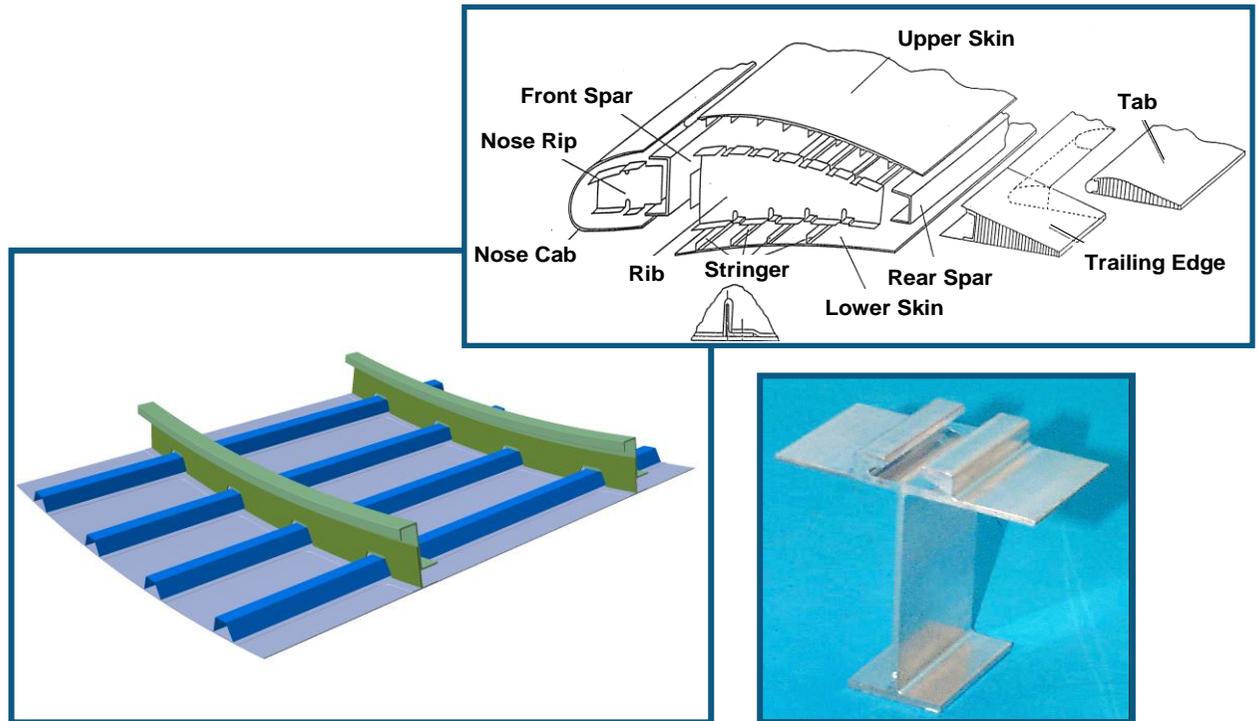

- High performance material with low density
- Extremely high strength combined with exceptional good notch ductility
- Better corrosion behaviour than 7xxx and new 2xxx alloys
- Application for conventional/integral design

Scalmalloy®: AGI' second-generation Al-Mg-Sc material

Highlight 2006 → Dr. Blanka Lenczowski / Frank Palm

- 4 year research activity results in a new class of high strength alloys with YS about 500 – 600 MPa.
- AlMgSc (*Scalmalloy*®) combines excellent strength and toughness with very high corrosion resistance

- Longer lasting profile solutions in highly corrosive environments (seat tracks, floor beams etc.)
- Welded lower shell fuselage panels with 20 – 30% higher load bearing capabilities
- Integrally designed high lift devices with improved in service behavior by lower manufacturing costs

Additive Layer Manufacturing (ALM) versus castings & more

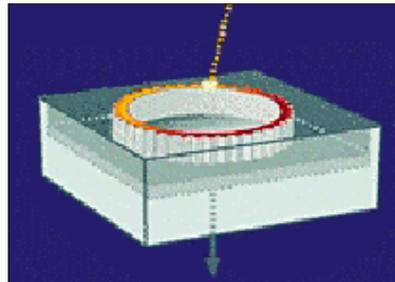

Development of loaded optimized parts by ALM

Rapid Technologie für Metalle (ALM)

Powder bed	Powder feed	Wire feed	Others
 <p>Trumpf</p>	 <p>Optomec</p>	 <p>Fraunhofer IPT</p>	 <p>Hermle</p>
<p>Laser beam based Electron beam based</p>	<p>Laser beam based</p>	<p>Laser beam based Electron beam based</p>	<p>e. g. Alchemy</p>
<p>Metals Ceramics Composites</p>	<p>Metals Composites Gradient materials</p>	<p>Metals Composites Gradient materials</p>	<p>Metals Composites Gradient materials</p>

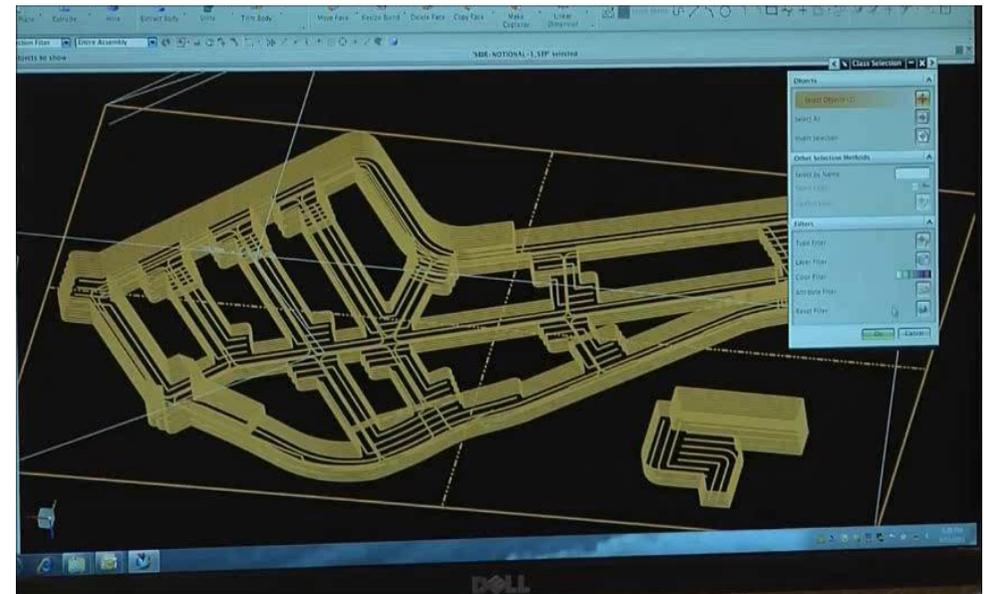

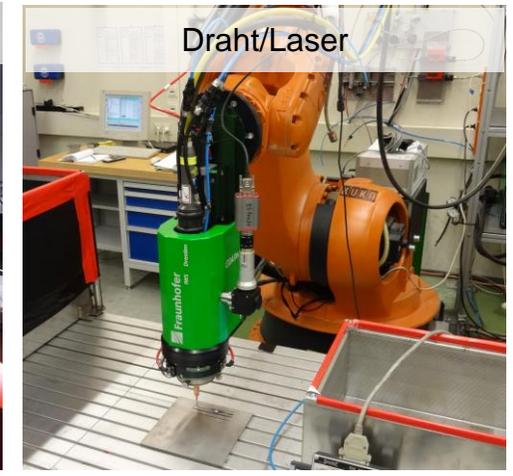

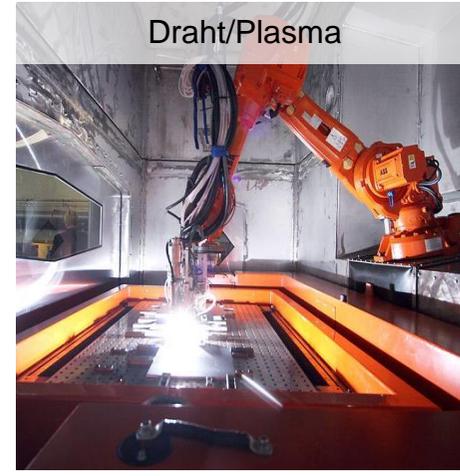

CAD-Model

Final Part

Al-Mg-Sc Material Technology

Additive Layer Manufacturing (ALM)

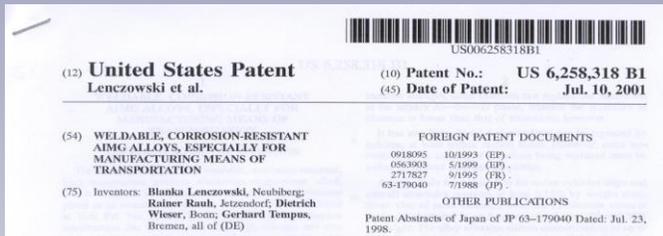

Al-Mg-Sc Material Technology

Technology Directions/Streams

Alloy Patents (IM):

- ➔ 1x Alloy with medium Mg
- 2x Alloys with ↑ Mg
- ➔ ScalmalloySc[®] ➔ Strip Casting

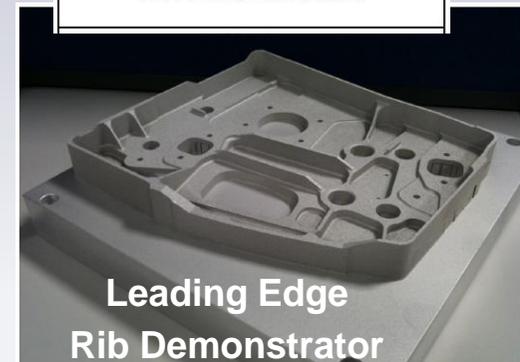

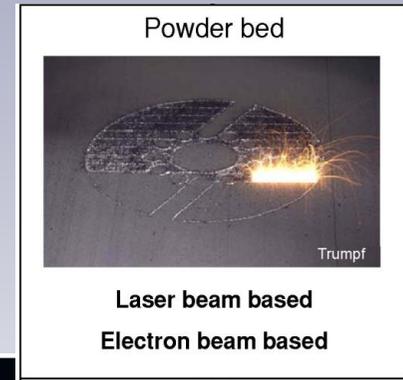

Alloy Process Know-How (PM)

- ➔ Scalmalloy[®] ➔ extrusion
- ➔ Scalmalloy RP for ALM

Forming Patent:

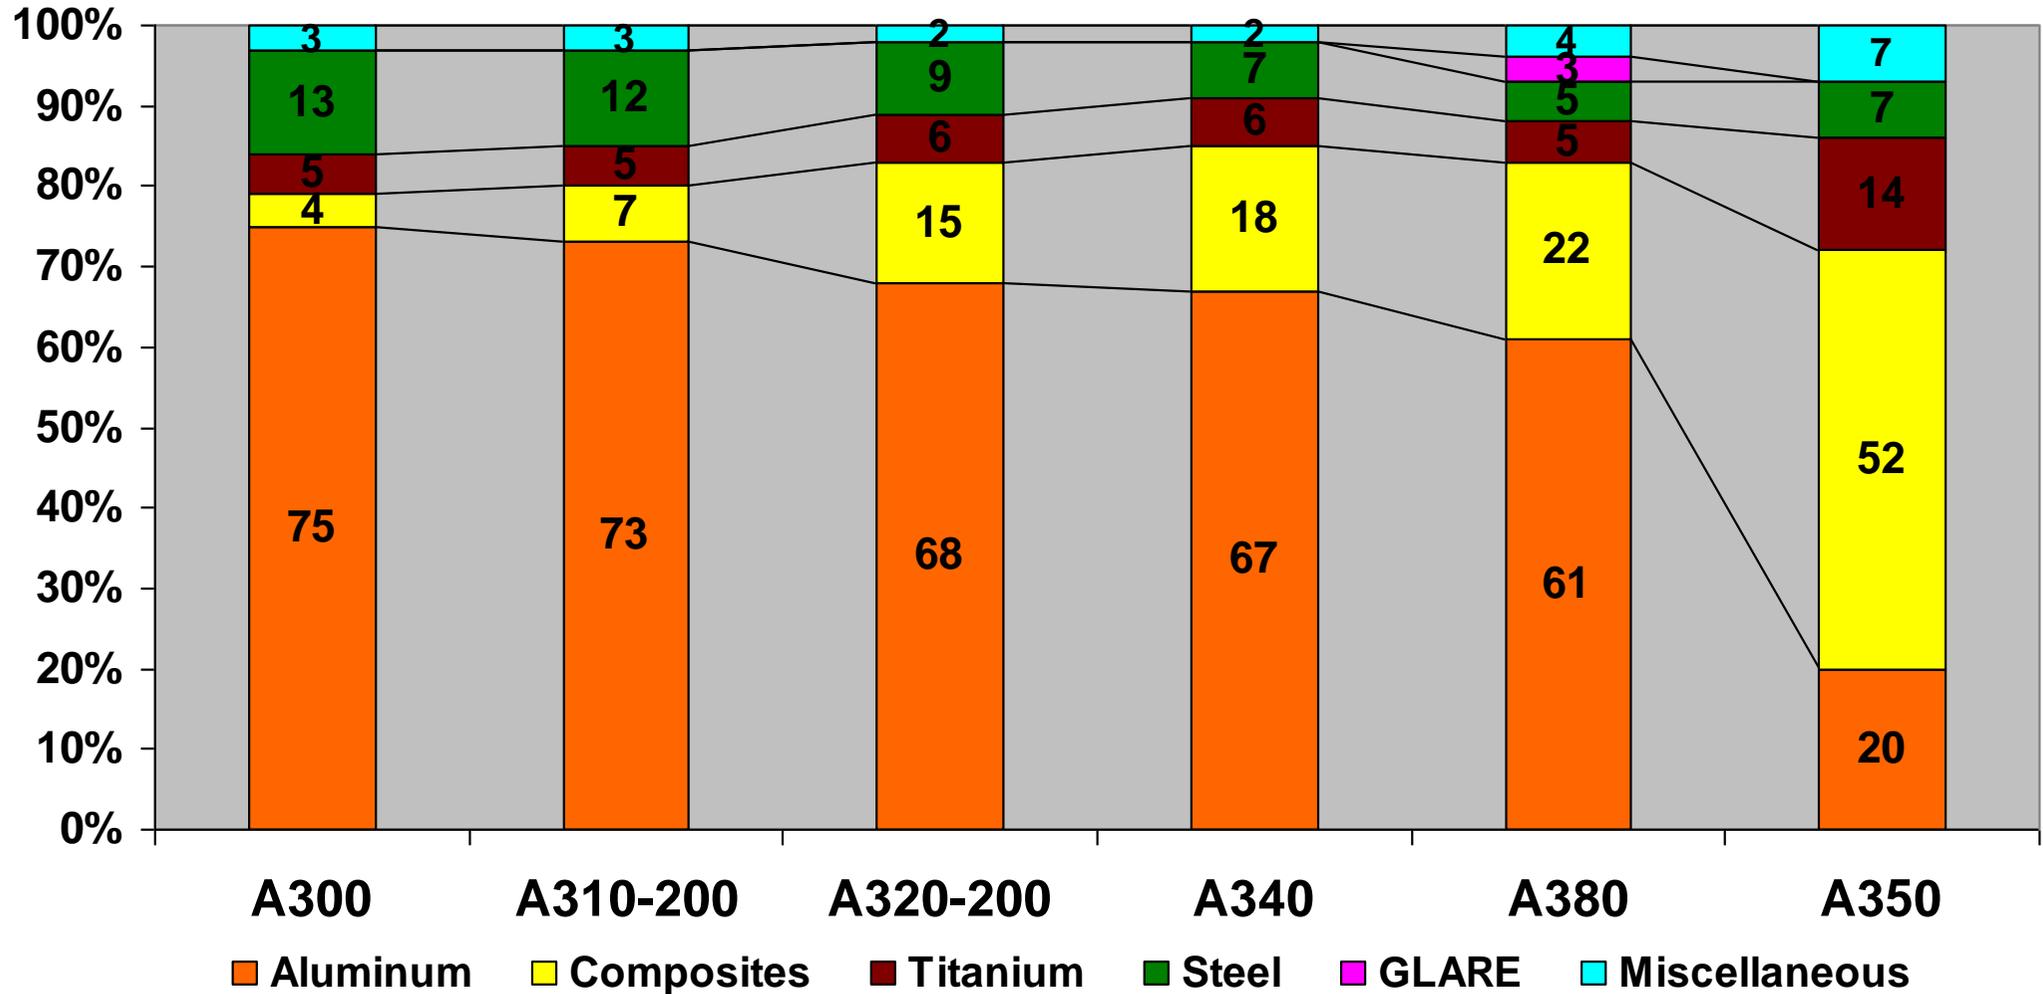

- ➔ 1x Creep forming of Al-structures

New materials for extended product life & to enhance competitiveness

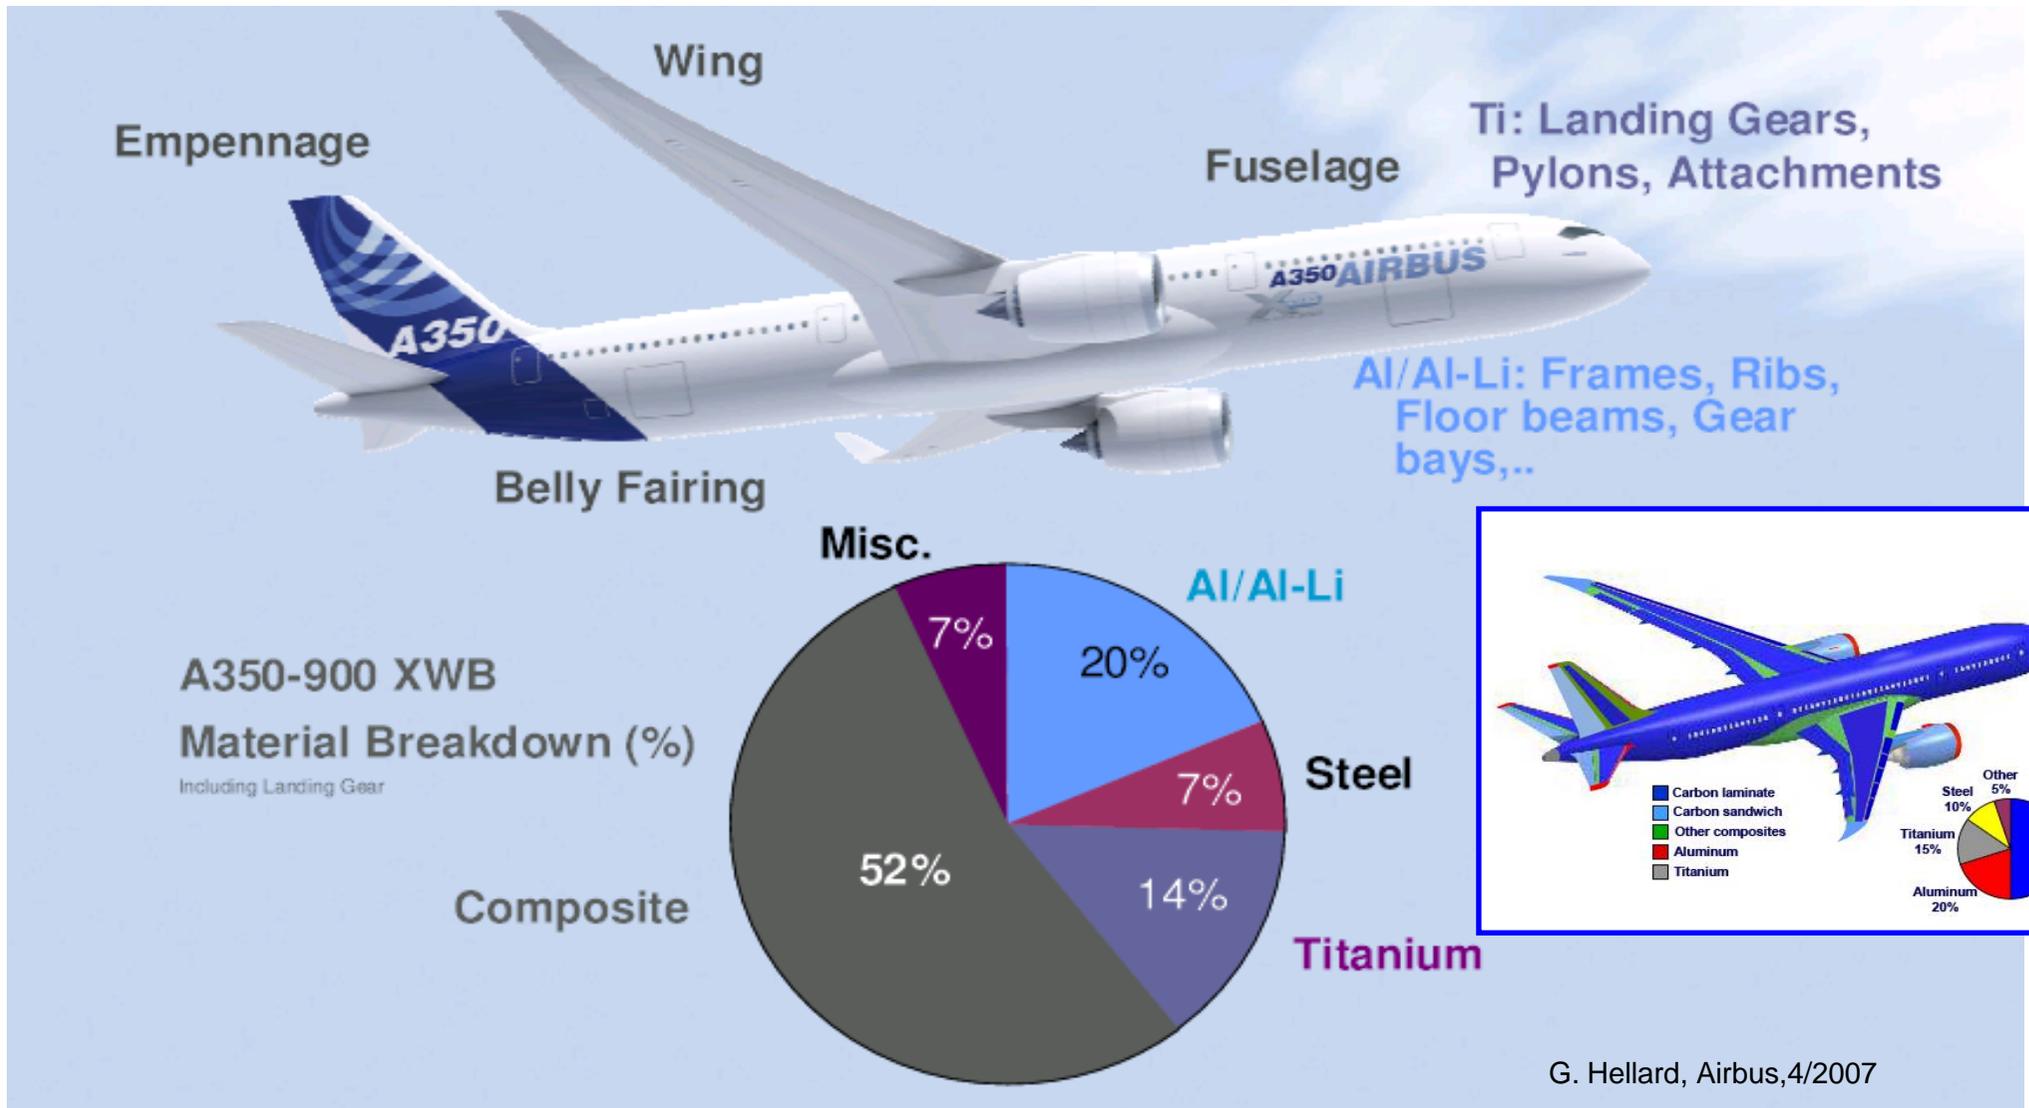

Material Distribution in the Airbus family

A350 XWB: Material Breakdown

A350 XWB puts the right material in the right place!

G. Hellard, Airbus, 4/2007

Thanks for your attention!
